February 10, 2017

The past two years have been rewarding for the First Things First Yuma Regional Partnership Council, as we delivered on our mission to build better futures for young children and their families. During the past year, we have touched many lives of young children and their families by developing and expanding our partnership with public preschools and private child care providers, expanding the scope and reach of family support programs including an oral health strategy. The council is also extremely proud of the successful collaboration efforts here in Yuma. Strong collaboration is essential to improving our early childhood system.

The First Things First Yuma Regional Partnership Council will continue to advocate and provide opportunities to improve access and affordability to a quality early learning system, family support services, increased awareness of family services in our Yuma region, and dedicated efforts to make sure children start kindergarten healthy and ready to succeed.

Our strategic direction has been guided by our Collaboration Meetings (Ex. Yuma County Early Childhood Collaborative), Town Halls, and the Needs and Assets reports, specifically created for the Yuma Region from 2008 to the new 2016 report. The Needs and Assets reports are vital to our continued work in building a true integrated early childhood system for our young children and our overall future. The Yuma Regional Council would like to thank our Needs and Assets Vendor the University Of Arizona, Norton School of Family & Consumer Sciences for their knowledge, expertise and analysis of the Yuma region. The new report will help guide our decisions as we move forward for young children and their families within the Yuma region.

Going forward, the First Things First Yuma Regional Partnership Council is committed to meeting the needs of young children by providing essential services and advocating for social change.

Thanks to our dedicated staff, volunteers and community partners, First Things First is making a real difference in the lives of our youngest citizens and throughout the entire State.

Thank you for your continued support.

Sincerely,

Rev. Dr. Darren Hawkins, Chair
Yuma Regional Partnership Council

Introductory Summary and Acknowledgments

Ninety percent of a child's brain develops before kindergarten and the quality of a child's early experiences impact whether their brain will develop in positive ways that promote learning. Understanding the critical role the early years play in a child's future success is crucial to our ability to foster each child's optimal development and, in turn, impact all aspects of wellbeing of our communities and our state.

This Needs and Assets Report for the Yuma Region helps us in understanding the needs of young children, the resources available to meet those needs and gaps that may exist in those resources. An overview of this information is provided in the Executive Summary and documented in further detail in the full report.

The First Things First Yuma Regional Partnership Council recognizes the importance of investing in young children and ensuring that families and caregivers have options when it comes to supporting the healthy development of young children in their care. This report provides information that will aid the Council's funding decisions, as well as our work with community partners on building a comprehensive early childhood system that best meets the needs of young children in our community.

It is our sincere hope that this information will help guide community conversations about how we can best support school readiness for all children in the Yuma region. This information may also be useful to stakeholders in our area as they work to enhance the resources available to young children and their families and as they make decisions about how best to support children birth to 5 years old in our area.

Acknowledgments:

We want to thank the Arizona Department of Economic Security and the Arizona Child Care Resource and Referral, the Arizona Department of Health Services, the Arizona Department of Education, the Census Bureau, the Arizona Department of Administration- Employment and Population Statistics, and the Arizona Health Care Cost Containment System for their contributions of data for this report, and their ongoing support and partnership with First Things First on behalf of young children.

To the current and past members of the Yuma Regional Partnership Council, your vision, dedication, and passion have been instrumental in improving outcomes for young children and families within the region. Our current efforts will build upon those successes with the ultimate goal of building a comprehensive early childhood system for the betterment of young children within the region and the entire state.

Executive Summary

Regional Description

The First Things First Yuma Region is defined as Yuma County, not including the lands belonging to the Cocopah Indian Tribe. The Arizona portion of the Fort Yuma-Quechan Reservation is also located within the region along the Colorado River near the city of Yuma.

Data Sources

The data contained in this report come from a variety of sources. Some data were provided to First Things First by state agencies, such as the Arizona Department of Economic Security (DES), the Arizona Department of Education (ADE), and the Arizona Department of Health Services (ADHS). Other data were obtained from publically available sources, including the 2010 U. S. Census, the American Community Survey (ACS), the Arizona Department of Administration (ADOA), and the Arizona Health Care Cost Containment System (AHCCCS). In addition, regional data from the 2012 First Things first Family and Community Survey (FCS) are included.

Population Characteristics

According to the U.S. Census, the Yuma Region had a population of 194,934 in 2010, of whom 17,983 (9%) were children under the age of six. One out of every five households (20%) in the region included a young child. According to the Arizona Department of Administration, the population of young children in Yuma County will steadily increase from 2010 through 2015 into 2020, whereas the population of young children in Arizona was projected to decrease from 2010 to 2015, but then begin increasing again into 2020. The increase in the population of young children in Yuma County (42%) is projected to be dramatically higher than the state of Arizona's projected increase (12%).

In the Yuma Region, 43 percent of children aged birth to 5 live with a foreign-born parent. The percentage of children living with a foreign-born parent in the region and county (43%) is much higher than across the state as a whole (28%). The percentage of young children in the Yuma Region and Yuma County living in a grandparent's household (19% for both) is also higher than the percentage statewide (14%). However, in the region and county, children living in a grandparent's household are less likely to be living in a household with no parent present (8% for both) than children living in grandparents' households in the state (15%).

Differences exist between the populations of the region and state relating to race, ethnicity, and language. Over three-quarters (76%) of young children in the Yuma Region and Yuma County are Hispanic or Latino. This is much higher than the percentage across the state (45%). A smaller proportion of adults (those aged 18 and older) than children identify as Hispanic or Latino across all geographic levels. Fifty-three percent of adults aged 18 and older in the region and county identify as Hispanic or Latino, which is again higher than the proportions across the state (25%). Household language use also reflects these demographic patterns; more households in the region and county (51% for both) report speaking a language other than English compared to households statewide (27%). Twelve percent of households in the region are limited-English-speaking households where Spanish is the primary language.

Economic Circumstances

The poverty rates among the total (all-age) population and the population of young children vary little by geographical level. For the total population, 20 percent of people in the Yuma Region and Yuma County live in poverty, similar to across state as a whole (18%). Although young children are consistently more likely to live in poverty than members of the total population, the populations of young children in poverty across the region, county and state are also very similar (27%, 27% and 28%, respectively). In addition to the families whose incomes fall below the federal poverty level, a substantial proportion of households in the region and county are considered low income (i.e., near but not below the federal poverty level [FPL]). Just over half of families with children aged four and under are living below 185 percent of the federal poverty level in the region and county (58% for both), more than across the state (48%). Based on 2014 Federal Poverty Level Guidelines, this means that family income is less than \$3,677 a month for a family of four.

Families in Yuma County tend to earn less than similar families across the state. Yuma County also has a large rate of unemployment, peaking in 2013 at 26 percent. Compared to the rest of the state where unemployment was highest in 2009 and 2010, unemployment in Yuma has remained much higher in recent years. Patterns of parental employment are fairly similar across the geographical designations.

Over a third (34%) of Yuma Region residents are spending more than 30 percent of their income on housing. This is a similar but slightly lower percentage than elsewhere in the state (36%). However, the rate of foreclosure (9.3 per 10,000 homes) was higher than the rate elsewhere in the state.

The percentages of children aged 5 and under receiving Temporary Assistance for Needy Families (TANF) from 2012 to 2014 were low for the region, county, and state. Other safety net programs, such as the Supplemental Nutrition Assistance Program (SNAP) and the school-based free or reduced-price lunch program, reached far more children. Over half of young children in the region, county, and state received SNAP benefits in the years 2012 through 2014, and nearly three-quarters of students were eligible for free or reduced-price lunch in the region during those years. For both TANF and SNAP, the percentage of young children receiving these benefits decreased between 2012 and 2014, although this may be due to funding and eligibility changes rather than reflecting decreased need.

Educational Indicators

Completion of education appears to be a challenge for the region. Over a quarter of adults aged 25 and older (28%) in the Yuma Region and Yuma County did not complete high school. This is a substantially higher percentage than across the state as a whole (14%). Adults in the Yuma Region are also less likely to have earned a bachelor's degree or higher (14% for both) than adults across Arizona (27%). However high school drop-out rates were similar in Yuma County and the state of Arizona across fiscal years 2012 to 2014, as were four- and five-year graduation rates. Graduation rates have declined slightly in both the county and the state in recent years.

Students are considered to “pass” Arizona’s Instrument to Measure Standards (AIMS) if they meet or exceed the standard. In Yuma County, about two-thirds (67%) of third grade students passed the AIMS Math test, compared to 69 percent across the state. On the reading test, students in Yuma County performed slightly worse than students statewide; 72 percent of 3rd graders passed the reading test compared to 78 percent across the state. Only four percent of 3rd graders in the county and three percent in the state scored “falls far below” in reading, whereas in math, nine percent of 3rd graders in Yuma County and 10 percent in Arizona received this score.

Early Learning

In 2014 there were 139 licensed child care providers in the Yuma Region, licensed to serve 5,339 children. Most of these providers were classified as child care centers (n=61) and family child care providers (n=58). The median cost of any child care arrangement in Yuma County is less than or equal to cost across the state. For example, residents in Yuma County tend to pay lower prices than other state residents for child care centers (e.g., \$26 vs \$42 per day for infant care) but the same price for approved family homes for 1 or 2 year olds (\$20 per day for both the county and state).

According to data from the American Community Survey, nearly four out of every ten children aged 3 and 4 were enrolled in nursery school, preschool, or kindergarten in the Yuma Region and Yuma County (39% for both). This is a slightly higher percentage than elsewhere in Arizona (35%).

In the Yuma Region, Yuma County, and across Arizona, most referrals made to the Arizona Early Intervention Program (AzEIP) in FY 2014 were for children aged 25 to 35 months. The pattern of children being served by AzEIP in 2014 was similar for the region, county, and the state with more 25 to 35 month olds being served than younger children. The number of Division of Developmental Disabilities (DDD) service visits for children aged 0-2 increased from 2013 to 2014 in the region and county but decreased across the state. For children aged 3-5, DDD service visits decreased for the region, county and state from 2013 to 2014.

Child Health

Characteristics of mothers who gave birth in 2013 differed for the Yuma Region and Yuma County when compared to the state of Arizona. In general, prenatal care in the region was less adequate than elsewhere in the state. For example, 13 percent of women in Yuma attended fewer than five prenatal visits, which was more than double the percentage in Arizona overall (5%). Similarly, 37 percent of women giving birth in the region and county had no prenatal care in the first trimester compared to 19 percent across the state as a whole; this means that the region is currently not meeting the Healthy People 2020 target of no more than 22.1 percent of women not receiving first-trimester care. Mothers in Yuma were also more likely to be younger and have a lower level of education than those giving birth across the state. Mothers in the Yuma Region and Yuma County were less likely to report smoking during pregnancy (2%) than other Arizona mothers (4%), but this was still above the Healthy People 2020 target of 1.4 percent.

Across the region, county, and state, infants born in 2013 were similar in terms of rates of low and high birth weight, premature birth, and the need for neonatal intensive care. Five percent of babies in the Yuma Region had low birth weights (at or below 2.5 kilograms) and eight percent were born premature (before 37 weeks gestation). The Yuma Region is meeting Healthy People 2020 targets for both the proportion of low birth weight and premature babies.

Unintentional injuries, requiring emergency department visits, for children under age six in the county and state declined between 2012 and 2014.

A key factor in health care is health insurance, and young children in the Yuma Region and Yuma County were more likely to be uninsured (14% for both) than children elsewhere in the state (10%). Across the region, county, and state, young children were less likely to be uninsured than members of the total (all-age) population, and as was true for young children, members of the total population in the Yuma Region were more likely to be uninsured (21% compared to the state (17%).

Nearly all children in child care in the Yuma Region had been immunized against seven important diseases. The immunization rates in the region were higher than rates elsewhere in the state. The Healthy People 2020 Target for vaccination coverage for children ages 19-35 months for the DTAP, polio and MMR vaccines is 90 percent, suggesting that the region is meeting this goal. However, given that state regulations require children enrolled in child care to be up to date on immunizations, it is possible that immunization rates for children in child care are higher than immunization rates for children not in child care. If that is the case, the rates for the entire population of children in these areas may be not be as high. Children in kindergarten were vaccinated at similar rates to children in child care in the region and county. For both age levels, the Yuma Region had lower rates of religious and personal belief exemptions from immunizations than the state.

Family Support and Literacy

The First Things First Family and Community Survey is a phone-based survey designed to measure many critical areas of parents' knowledge, skills, and behaviors related to their young children. In the Yuma Region, 150 people responded to the 2012 First Things First Family and Community Survey. Among other topics, the survey collected data about parent and caregiver knowledge of children's early development and their involvement in a variety of behaviors known to contribute positively to healthy development. Parents in the Yuma Region were less likely to report reading to their children (35%), telling stories to their children (42%), and drawing with their child (34%) six or seven days a week compared to families across the state (51%, 51% and 47% respectively). Over three-quarters of parents (83%) in the Yuma Region showed an understanding that brain development can be impacted prenatally or right from birth, similar to respondents across the state as a whole.

Communication, Public Information and Awareness

In addition to measuring parent knowledge, skills, and behaviors related to their young children, the 2012 First Things First Family and Community Survey collected data on parents' perceptions regarding resources available to young children and their families across Arizona.

Eighty-four percent of responding parents in the Yuma Region indicated they were “very” or “somewhat satisfied” with “the community information and resources available to them about their children’s development and health” compared to 78 percent of respondents across the state. While parents found the information satisfactory, 30 percent of Yuma parents reported some difficulty in locating needed or desired services.

Systems Coordination among Early Childhood Programs and Services

The 2012 First Things First Family and Community Survey also collected data on parents’ perceptions regarding how well agencies that serve young children and their families coordinate and collaborate. One item from the 2012 Family and Community Survey addresses the issue of perceived early childhood system coordination. Respondents in the both the Yuma Region and the state were more likely to indicate satisfaction (43% in the region and the state) than dissatisfaction (29% in both the region and the state) with how care providers and government agencies work together and communicate.

The Yuma Region

Regional Description

The First Things First regional boundaries were initially established in 2007, creating 31 regions which were designed to (a) reflect the view of families in terms of where they access services, (b) coincide with existing boundaries or service areas of organizations providing early childhood services, (c) maximize the ability to collaborate with service systems and local governments, and facilitate the ability to convene a Regional Partnership Council, and (d) allow for the collection of demographic and indicator data. The regional boundaries are reviewed every two years. In fiscal year 2015, the boundaries were modified using census blocks, creating 28 regions. This report uses the 2015 definition of the regional boundaries.

The First Things First Yuma Region is defined as Yuma County, not including the lands belonging to the Cocopah Indian Tribe. The Arizona portion of the Fort Yuma--Quechan Reservation is also located within the region along the Colorado River near the city of Yuma. The Yuma Region is located in Southwest Arizona bordering Mexico and California and covers 5,522 square miles. The region's major towns and cities include Yuma, Somerton, San Luis, and Wellton. This region is primarily desert but also has mountains and river valleys. The Yuma Proving Ground and the Barry M Goldwater West Range also comprise large, uninhabited areas within the Yuma Region.

Figure 1 shows the geographical area covered by the Yuma Region. Additional information available at the end of this report includes a map of the region by zip code in Appendix 1, a table listing zip codes for the region in Appendix 2, and a map of school districts in the region in Appendix 3.

Figure 1. The Yuma Region

Source: U.S. Census Bureau (2010). TIGER/Line Shapefiles: TabBlocks, Streets, Counties, American Indian/Alaska Native Homelands. Retrieved from <http://www.census.gov/geo/maps-data/data/tiger-line.html>

Data Sources

The data contained in this report come from a variety of sources. Some data were provided to First Things First by state agencies, such as the Arizona Department of Economic Security (DES), the Arizona Department of Education (ADE), and the Arizona Department of Health Services (ADHS). Other data were obtained from publically available sources, including the 2010 U.S. Census, the American Community Survey (ACS), the Arizona Department of Administration (ADOA), and the Arizona Health Care Cost Containment System (AHCCCS). In addition, regional data from the 2012 First Things first Family and Community Survey (FCS) are included.

The U.S. Census¹ is an enumeration of the population of the United States. It is conducted every ten years, and includes information about housing, race, and ethnicity. The 2010 U.S. Census data are available by census block. There are about 115,000 inhabited blocks in Arizona, with an average population of 56 people each. The Census data for the Yuma Region presented in this report were calculated by identifying each block in the region, and aggregating the data over all of those blocks. (Note that the Census 2010 data in the current report may vary to a small degree from census data reported in previous Needs & Assets reports. The reason is that in the previous reports, the Census 2010 data were aggregated by zip code; the current report uses aggregation by census blocks.)

The American Community Survey² is a survey conducted by the U.S. Census Bureau each month by mail, telephone, and face-to-face interviews. It covers many different topics, including income, language, education, employment, and housing. The ACS data are available by census tract. Arizona is divided into about 1,500 census tracts, with an average of about 4,200 people in each. The ACS data for the Yuma Region were calculated by aggregating over the census tracts which are wholly or partially contained in the region. The data from partial census tracts were apportioned according to the percentage of the 2010 Census population in that tract living inside the Yuma Region. The most recent and most reliable ACS data are averaged over the past five years; those are the data included in this report. They are based on surveys conducted from 2009 to 2013. In general, the reliability of ACS estimates is greater for more populated areas. Statewide estimates, for example, are more reliable than county-level estimates.

To protect the confidentiality of program participants, the First Things First Data Dissemination and Suppression Guidelines preclude our reporting social service and early education programming data if the count is less than ten, and preclude our reporting data related to health or developmental delay if the count is less than twenty-five. In addition, some data received from state agencies may be suppressed according to their own guidelines. The Arizona Department of Health Services, for example, does not report counts less than six. Throughout this report, information which is not available because of suppression guidelines will be indicated by entries of “N/A” in the data tables.

Population Characteristics

Why it Matters

The characteristics of families living within a region can influence the availability of resources and supports for those families.³ Population characteristics and trends in family composition are often considered by policymakers when making decisions about the type and location of services to be provided within a region such as schools, health care facilities and services, and social services and programs. As a result of these decisions, families with young children may have very different experiences within and across regions regarding access to employment, food resources, schools, health care facilities and providers, and social services. It is important, therefore, that decision-makers understand who their constituents are so that they can prioritize policies that address the needs of diverse families with young children. Accurate and up-to-date information about population characteristics such as the number of children and families in a geographic region, their ethnic composition, whether their parents were born abroad, living arrangements and languages spoken can support the development or continuation of resources that are linguistically, culturally, and geographically most appropriate for a given locale.

In addition to being affected by community resources, the likelihood of a child reaching his or her optimal development can also be affected by the supports and resources available within the family.^{4,5} The availability of family resources can be influenced by the characteristics of the family structure, such as who resides in a household and who is responsible for a child's care. Children living with and being cared for by relatives or caregivers other than parents, is increasingly common.⁶ Those providing this type of care, such as friends, aunts, uncles, siblings and grandparents, may be in need of special support. Raising or supporting young children may pose a particular challenge for aging grandparents, as they often lack information on resources,

support services, benefits and policies available to aid in their caregiving role.⁷ Often, grandparents take on child rearing responsibilities when parents are unable to provide care because of the parent's death, unemployment or underemployment, physical or mental illness, substance abuse, incarceration, or because of domestic violence or child neglect in the family.⁸ Caring for children who have experienced family trauma can pose an even greater challenge to grandparents, who may be in need of specialized assistance and resources to support their grandchildren.

Understanding language use in the region can also contribute to being better able to serve the needs of families with young children. Language preservation and revitalization have been recognized by the U.S. Department of Health & Human Services as keys to strengthening culture in Native communities and to encouraging communities to move toward social unity and self-sufficiency.⁹ Special consideration should be given to respecting and supporting the numerous Native languages spoken by families, particularly in tribal communities around the state. In addition, assuring that early childhood resources and services are available in Spanish is important in many areas of Arizona, given that five percent of the households in the state are limited English speaking households (that is, a household where none of the members speak English very well). Language barriers for these families can limit their access to health care and social services, and can provide challenges to communication between parents and their child's teachers, which can impact the quality of education children are able to receive.¹⁰

What the Data Tell Us

According to the U.S. Census, the Yuma Region had a population of 194,934 in 2010, of whom 17,983 (9%) were children under the age of six (see Table 1). One out of every five households (20%) in the region included a young child. According to the Arizona Department of Administration, the population of young children in Yuma County will steadily increase from 2010 through 2015 into 2020, whereas the population of young children in Arizona was projected to decrease from 2010 to 2015, but then begin increasing again into 2020 (see Table 3). The increase in the population of young children in Yuma County (42%) is projected to be dramatically higher than the state of Arizona's projected increase (12%).

In the Yuma Region, 43 percent of children aged birth to 5 live with a foreign-born parent. The percentage of children living with a foreign-born parent in the region and county (43%) is much higher than across the state as a whole (28%) (see Table 4). The percentage of young children in the Yuma Region and Yuma County living in a grandparent's household (19% for both) is also higher than the percentage statewide (14%) (see Table 5). However, in the region and county, children living in a grandparent's household are less likely to be living in a household with no parent present (8% for both) than children living in grandparents' households in the state (15%) (see Table 6).

Differences exist between the populations of the region and state relating to race, ethnicity, and language. Over three-quarters (76%) of young children in the Yuma Region and Yuma County are Hispanic or Latino (see Table 7). This is much higher than the percentage across the state (45%). A smaller proportion of adults (those aged 18 and older) than children identify as Hispanic or Latino across all geographic levels. Fifty-three percent of adults aged 18 and older in the region and county identify as Hispanic or Latino, which is again higher than the proportions across the state (25%) (see Table 8). Household language use also reflects these demographic patterns; more households in the region and county (51% for both) report speaking a language other than English compared to households statewide (27%) (see Table 9). Twelve percent of households in the region are limited-English-speaking households where Spanish is the primary language.

Economic Circumstances

Why it Matters

Many economic factors contribute to a child's well-being, including family income, parent employment status, and the availability of safety-net programs such as housing and nutrition assistance.^{11,12} Understanding the economic context in which families with young children live is crucial when designing programs and policies intended to assist them.

Employment rates and income are common indicators of economic well-being. Unemployment and job loss often results in families having fewer resources to meet their regular monthly expenses and support their children's development. Family dynamics can be negatively impacted by job loss as reflected in higher levels of parental stress, family conflict and more punitive parental behaviors.¹³ Parental job loss can also impact children's school performance (shown by lower test scores, poorer attendance, higher risk of grade repetition, suspension or expulsion among children whose parents have lost their jobs.)¹⁴ Unemployment rates, therefore, can be an indicator of family stress, and are also an important indicator of regional economic vitality.

Employment rates and job opportunities contribute to the income families have available. It is estimated that families need an income of about twice the federal poverty level (FPL)¹⁵ to meet basic needs.¹⁶ Families earning less may experience unstable access to basic resources like food and housing. Food insecurity – the lack of reliable access to affordable, nutritious food – negatively impacts the health and well-being of children, including a heightened risk for developmental delays.¹⁷ High housing costs, relative to income, are associated with increased risk

for homelessness, overcrowding, poor nutrition, frequent moving, lack of supervision while parents are at work, and low cognitive achievement.¹⁸ Poverty, especially among children, can have far reaching negative consequences, including an effect on brain development and later cognitive ability.¹⁹

Public assistance programs are one way of combating the effects of poverty and providing supports to children and families in need. Temporary Assistance for Needy Families²⁰ (TANF, which has replaced previous welfare programs) provides cash assistance and services to the very poor and can help offset some of the economic circumstances of families that may have a detrimental effect on young children. Another safety net program, the Supplemental Nutrition Assistance Program (SNAP, also referred to as “Nutrition Assistance” and “food stamps”) has been shown to help reduce hunger and improve access to healthier food.²¹ SNAP benefits support working families whose incomes simply do not provide for all their needs. For low-income working families, the additional income from SNAP is substantial. For example, for a three-person family with one person whose wage is \$10 per hour, SNAP benefits boost take-home income by ten to 20 percent.²² Similarly, the National School Lunch Program²³ provides free and reduced-price meals at school for students whose families meet income criteria. These income criteria are 130 percent of the federal poverty level (FPL) for free lunch, and 185 percent of the FPL for reduced price lunch.

²⁰ In Arizona, TANF eligibility is capped at \$335 per month, or \$4020 annually for a family of four, and has recently undergone significant changes. Beginning in 2016, Arizona will become the first and only state that limits a person's lifetime benefit to 12 months. In addition, since 2009, a steadily decreasing percentage of Arizona TANF funds have been spent on three of the key assistance categories: cash assistance to meet basic needs, helping connect parents to employment opportunities, and child care. In 2013, Arizona ranked 51st, 47th, and 46th respectively in proportional spending in those categories across all states and the District of Columbia. Meanwhile, since 2009, an increasing percentage of Arizona TANF funds have been spent on other costs such as child protection, foster care, and adoption. Sources: Reilly, T., and Vitek, K. (2015). *TANF cuts: Is Arizona shortsighted in its dwindling support for poor families?* Retrieved from: https://morrisoninstitute.asu.edu/sites/default/files/content/products/TANF.doc_0.pdf ; Floyd, I., Pavetti, L., and Schott, L. What the Data Tell Us

The poverty rates among the total (all-age) population and the population of young children vary little by geographical level. For the total population, 20 percent of people in the Yuma Region and Yuma County live in poverty, similar to across the state as a whole (18%) (see Figure 5). Although young children are consistently more likely to live in poverty than members of the total population, the populations of young children in poverty across the region, county and state are also very similar (27%, 27% and 28%, respectively). In addition to the families whose incomes fall below the federal poverty level, a substantial proportion of households in the region and county are considered low income (i.e., near but not below the federal poverty level [FPL]). Just over half of families with children aged four and under are living below 185 percent of the federal poverty level in the region and county (58% for both), more than across the state (48%) (see Table 10). Based on 2014 Federal Poverty Level Guidelines,²⁴ this means that family income is less than \$3,677 a month for a family of four.

Families in Yuma County tend to earn less than similar families across the state (see Figure 6). Yuma County also has a large rate of unemployment, peaking in 2013 at 26 percent. Compared to the rest of the state where unemployment was highest in 2009 and 2010, unemployment in Yuma has remained much higher in recent years (see Figure 7). Patterns of parental employment are fairly similar across the geographical designations (see Table 11).

Over a third (34%) of Yuma Region residents are spending more than 30 percent of their income on housing. This is a similar but slightly lower percentage than elsewhere in the state (36%) (see Table 13). However, the rate of foreclosure (9.3 per 10,000 homes) was higher than the rate elsewhere in the state.

The percentages of children aged 5 and under receiving Temporary Assistance for Needy Families (TANF) from 2012 to 2014 were low for the region, county, and state (see Table 14). Other safety net programs, such as the Supplemental Nutrition Assistance Program (SNAP) and the school-based free or reduced-price lunch program, reached far more children. Over half of young children in the region, county, and state received SNAP benefits in the years 2012 through 2014 (see Table 15), and nearly three-quarters of students were eligible for free or reduced-price lunch in the region during those years (see Table 16). For both TANF and SNAP, the percentage of young children receiving these benefits decreased between 2012 and 2014, although this may be due to funding and eligibility changes rather than reflecting decreased need.

Educational Indicators

Why it Matters

Characteristics of educational involvement and achievement in a region, such as school attendance, standardized tests scores, graduation rates, and the overall level of education of adults, all impact the developmental and economic resources available to young children and their families. Education, in and of itself, is an important factor in how able parents and caregivers are to provide for the children in their care. Parents who graduate from high school earn more and are less likely to rely on public assistance programs than those without high school degrees.^{25,26} Higher levels of education are associated with better housing, neighborhood of residence, and working conditions, all of which are important for the health and well-being of children.^{27,28}

Early school attendance and performance can set the stage for later achievement.

Absenteeism in kindergarten is already an indicator of the likelihood of higher rates of absences later in a student's school career, as well as lower achievement in reading and math.²⁹ By third grade, reading ability is strongly associated with high school completion. One in six third graders who do not read proficiently will not graduate from high school on time, and the rates are even higher (23%) for children who were both not reading proficiently in third grade and living in poverty for at least a year.³⁰ In recognition of the importance of assuring that children are reading by the third grade, legislators enacted the Arizona Revised Statute §15-701 (also known as the *Move on When Reading* law) which states that as of school year 2013-2014 a student shall not be promoted from the third grade if the student obtains a score on the statewide reading assessment "that demonstrates that the pupil's reading falls far below the

third-grade level.” Exceptions exist for students identified with or being evaluated for learning disabilities, English language learners, and those with reading impairments.

From 2000-2014, the primary in-school performance of students in the public elementary schools in the state has been measured by Arizona’s Instrument to Measure Standards (AIMS).³¹ AIMS scores were used to meet the requirement of *Move on When Reading*.

However, a new summative assessment system which reflects Arizona’s K-12 academic standards, Arizona’s Measurement of Educational Readiness to Inform Teaching (AzMERIT), was implemented in the 2014-2015 school year.³² This assessment replaced the reading and mathematics portions of the AIMS test. Although it is not a graduation requirement, it will still be used to determine promotion from the third grade in accordance with Arizona Revised Statute §15-701.³³

AIMS results are included in this report, but future reports will use AzMERIT scores as they become available.

In order for children to be prepared to succeed on tests such as the AIMS or AzMERIT, research shows that early reading experiences, opportunities to build vocabularies and literacy rich environments are the most effective ways to support the literacy development of young children.³⁴

What the Data Tell Us

Completion of education appears to be a challenge for the region. Over a quarter of adults aged 25 and older (28%) in the Yuma Region and Yuma County did not complete high school (see Figure 8). This is a substantially higher percentage than across the state as a whole (14%). Adults in the Yuma Region are also less likely to have earned a bachelor’s degree or higher (14% for both) than adults across Arizona (27%). However high school drop-out rates were similar in Yuma County and the state of Arizona across fiscal years 2012 to 2014, as were four- and five-year graduation rates (see Table 17). Graduation rates have declined slightly in both the county and the state in recent years.

Students are considered to “pass” Arizona’s Instrument to Measure Standards (AIMS) if they meet or exceed the standard. In Yuma County, about two-thirds (67%) of third grade students passed the AIMS Math test, compared to 69 percent across the state (see Figure 9). On the reading test, students in Yuma County performed slightly worse than students statewide; 72 percent of 3rd graders passed the reading test compared to 78 percent across the state (see Figure 10). Only four percent of 3rd graders in the county and three percent in the state scored “falls far below” in reading, whereas in math, nine percent of 3rd graders in Yuma County and 10 percent in Arizona received this score.

Early Learning

Why it Matters

Early childhood marks a time of peak plasticity in the brain, and early adversity can weaken the foundation upon which future learning will be built; in other words, positive developmental experiences in early life are crucial.³⁵ Research has shown that the experiences that children have from birth to five years of age influence future health and well-being, and that supporting children during this time has a great return on investment.³⁶ Investing in high-quality early childhood programs, particularly for disadvantaged children, provides substantial benefits to society through increased educational achievement and employment, reductions in crime, and better overall health of those children as they mature into adults.^{37,38} Children whose education begins with high-quality preschool repeat grades less frequently, obtain higher scores on standardized tests, experience fewer behavior problems, and are more likely to graduate high school.³⁹

The ability of families to access quality, affordable early care and education opportunities, however, can be limited. The annual cost of full-time center-based care for a young child in Arizona is only slightly less than a year of tuition and fees at a public college.⁴⁰ Although the Department of Health and Human Services recommends that parents spend no more than 10 percent of their family income on child care,⁴¹ the cost of center-based care for a single infant,

toddler, or 3-5 year old is an estimated 17, 15 and 11 percent, respectively, of an average Arizona family's income.⁴²

Child care subsidies can help families who otherwise would be unable to access early learning services.⁴³ However, the availability of this type of support is also limited. The number of children receiving Child Care and Development Fund (CCDF) subsidies in Arizona is low. In 2014, only 26,685 children aged birth to 5 (about 5% of Arizona's children in this age range) received CCDF vouchers. With half of young children in Arizona living below the federal poverty level, the number in need of these subsidies is likely much higher than those receiving them.

The availability of services for young children with special needs is an ongoing concern across the state, particularly in more geographically remote communities. The services available to families include early intervention screening and intervention services provided through the Arizona Department of Education AZ FIND (Child Find),⁴⁴ the Arizona Early Intervention Program (AzEIP)⁴⁵ and the Division of Developmental Disabilities (DDD).⁴⁶ These programs help identify and assist families with young children who may need additional support to meet their potential. Timely intervention can help young children with, or at risk for, developmental delays improve language, cognitive, and social/emotional development. It also reduces educational costs by decreasing the need for special education.^{47,48,49}

⁴² The cost of center-based care as a percentage of income is based on the Arizona median annual family income of \$58,900.

What the Data Tell Us

In 2014 there were 139 licensed child care providers in the Yuma Region, licensed to serve 5,339 children (see Table 20). Most of these providers were classified as child care centers (n=61) and family child care providers (n=58). The median cost of any child care arrangement in Yuma County is less than or equal to cost across the state (see Table 21). For example, residents in Yuma County tend to pay lower prices than other state residents for child care centers (e.g., \$26 vs \$42 per day for infant care) but the same price for approved family homes for 1 or 2 year olds (\$20 per day for both the county and state).

According to data from the American Community Survey, nearly four out of every ten children aged 3 and 4 were enrolled in nursery school, preschool, or kindergarten in the Yuma Region and Yuma County (39% for both). This is a slightly higher percentage than elsewhere in Arizona (35%) (see Table 23).

In the Yuma Region, Yuma County, and across Arizona, most referrals made to the Arizona Early Intervention Program (AzEIP) in FY 2014 were for children aged 25 to 35 months (see Table 24). The pattern of children being *served* by AzEIP in 2014 was similar for the region, county, and the state with more 25 to 35 month olds being served than younger children. The number of Division of Developmental Disabilities (DDD) service visits for children aged 0-2 increased from 2013 to 2014 in the region and county but decreased across the state (see Table 25). For children aged 3-5, DDD service visits decreased for the region, county and state from 2013 to 2014 (see Table 26).

Child Health

Why it Matters

The Institute of Medicine defines children’s health as the extent to which children are able or enabled to develop and realize their potential, satisfy their needs, and develop the capacities that allow them to successfully interact with their biological, physical, and social environments.⁵⁰ Health therefore encompasses not only physical health, but also mental, intellectual, social, and emotional well-being. Children’s health can be influenced by their mother’s health and the environment into which they are born and raised.^{51,52} The health of a child in utero, at birth, and in early life can impact many aspects of a child’s development and later life. Factors such as a mother’s prenatal care, access to health care and health insurance, and receipt of preventive care such as immunizations and oral health care all influence not only a child’s current health, but long-term development and success as well.^{53,54,55} In addition, nonfatal unintentional injuries substantially impact the well-being of children,⁵⁶ and injuries are the leading cause of death in children in the United States.⁵⁷

Healthy People is a science-based government initiative which provides 10-year national objectives for improving the health of Americans. Healthy People 2020 targets are developed

with the use of current health data, baseline measures, and areas for specific improvement. Understanding where Arizona mothers and children fall in relation to these national benchmarks can help highlight areas of strength in relation to young children's health and those in need of improvement in the state. The Arizona Department of Health Services monitors state level progress towards a number of maternal, infant and child health objectives for which data are available at the regional level, including increasing the proportion of pregnant women who receive prenatal care in the first trimester; reducing low birth weight; reducing preterm births; and increasing abstinence from cigarette smoking among pregnant women.⁵⁸ Although not a target of a Healthy People 2020 objective, high-birth weight, or macrosomia, is also associated with health risks for both the mother and infant during birth. These children are also at increased risk for obesity and metabolic syndrome (which is linked to an increase risk of heart disease, stroke, and diabetes).⁵⁹

The ability to obtain health care is critical for supporting the health of young children. In the early years of a child's life, well-baby and well-child visits allow clinicians to offer developmentally appropriate information and guidance to parents and provide a chance for health professionals to assess the child's development and administer preventative care measures like vaccines and developmental screenings. Without health insurance, each visit can be prohibitively expensive and may be skipped.⁶⁰

What the Data Tell Us

Characteristics of mothers who gave birth in 2013 differed for the Yuma Region and Yuma County when compared to the state of Arizona (see Table 27). In general, prenatal care in the region was less adequate than elsewhere in the state. For example, 13 percent of women in Yuma attended fewer than five prenatal visits, which was more than double the percentage in Arizona overall (5%). Similarly, 37 percent of women giving birth in the region and county had no prenatal care in the first trimester compared to 19 percent across the state as a whole; this means that the region is currently not meeting the Healthy People 2020 target of no more than 22.1 percent of women not receiving first-trimester care (see Figure 11). Mothers in Yuma

⁶⁰ Yeung, LF, Coates, RJ, Seeff, L, Monroe, JA, Lu, MC, & Boyle, CA. (2014). *Conclusions and future directions for periodic reporting on the use of selected clinical preventive services to improve the health of infants, children, and adolescents—United States. Morbidity and Mortality Weekly Report 2014, 63(Suppl-2), 99-107*. Retrieved from <http://www.cdc.gov/mmwr/pdf/other/su6302.pdf>.

were also more likely to be younger and have a lower level of education than those giving birth across the state (See Table 27). Mothers in the Yuma Region and Yuma County were less likely to report smoking during pregnancy (2%) than other Arizona mothers (4%), but this was still above the Healthy People 2020 target of 1.4 percent (see Figure 11).

Across the region, county, and state, infants born in 2013 were similar in terms of rates of low and high birth weight, premature birth, and the need for neonatal intensive care (see Table 28). Five percent of babies in the Yuma Region had low birth weights (at or below 2.5 kilograms) and eight percent were born premature (before 37 weeks gestation). The Yuma Region is meeting Healthy People 2020 targets for both the proportion of low birth weight and premature babies (see Figure 12).

Unintentional injuries, requiring emergency department visits, for children under age six in the county and state declined between 2012 and 2014 (see Table 29).

A key factor in health care is health insurance, and young children in the Yuma Region and Yuma County were more likely to be uninsured (14% for both) than children elsewhere in the state (10%) (see Figure 15). Across the region, county, and state, young children were less likely to be uninsured than members of the total (all-age) population, and as was true for young children, members of the total population in the Yuma Region were more likely to be uninsured (21%) compared to the state (17%).

Nearly all children in child care in the Yuma Region had been immunized against seven important diseases (see Table 31). The immunization rates in the region were higher than rates elsewhere in the state. The Healthy People 2020 Target for vaccination coverage for children ages 19-35 months for the DTAP, polio and MMR vaccines is 90 percent,⁶¹ suggesting the region is meeting this goal. However, given that state regulations require children enrolled in child care to be up to date on immunizations, it is possible that the rates of immunization for children in child care are higher than immunization rates for children not in child care.⁶² If that is the case, the rates for the entire population of children in these areas may not be as high. Children in kindergarten were vaccinated at similar rates to children in child care in the region

⁶¹ U.S. Department of Health and Human Services, Office of Disease Prevention and Health Promotion. (2015). *Immunization and Infectious Diseases*. Washington, DC. Retrieved from: <https://www.healthypeople.gov/2020/topics-objectives/topic/immunization-and-infectious-diseases/objectives>

⁶² For example, the National Immunization Survey (NIS) monitors vaccination coverage among U.S. children aged 19–35 months, and estimates the Arizona statewide rate for DTAP (Diphtheria, Tetanus, Pertussis, 4 or more doses) to be about 81 percent and the statewide rate for MMR (Measles, Mumps and Rubella, 1 or more doses) to be about 84 percent. Source: Hill, H., Elam-Evans, L., Yankey, D., Singleton, J., Kolasa, M. (2015). National, state, and selected local area vaccination coverage among children aged 19–35 months — United States. *Morbidity and Mortality Weekly*, 2014, 64(33), 889-896. Retrieved from: <http://www.cdc.gov/mmwr/preview/mmwrhtml/mm6433a1.htm>

and county (see Table 32). For both age levels, the Yuma Region had lower rates of religious and personal belief exemptions from immunizations than the state.

Family Support and Literacy

Why it Matters

Parents and families have a crucial role in providing nurturing and stable relationships for optimal brain development during their child's first years.^{63,64,65} When children experience nurturing, responsive caregiving, they face better life prospects across a number of social, physical, academic and economic outcomes.^{66,67} Consequently, healthy development depends on positive relationships between children and their caregivers from an early age.⁶⁸ For parents of young children, reading aloud, singings songs, practicing nursery rhymes, and engaging in conversation primes children to reach their full potential. Such interactions not only support literacy skills, but also offer exposure to a range of ideas, including recognizing and naming emotions, an important socio-emotional skill. Parents and family are children's first teachers; the most rapid expansion in vocabulary happens between ages one and three.⁶⁹ In fact, literacy promotion is so central to a child's development that the American Academy of Pediatrics has recently focused on it as a key issue in primary pediatric care, aiming to make parents more aware of their important role in literacy.⁷⁰

Data on the amount and quality of the interaction parents typically have with their children can be useful to inform programs and policies to encourage positive engagement. Communities may employ many resources to support families in engaging with their children. Examples of

these opportunities include: home visitation programs; “stay and play” programs featuring developmentally appropriate activities for children and their parents; Read On Arizona, a program that promotes early literacy; and the national “Reach Out & Read” program, in which nearly 200 clinics and pediatric practices across the state seeing children for a well-child visit provide them with a book to take home.⁷¹

What the Data Tell Us

The First Things First Family and Community Survey is a phone-based survey designed to measure many critical areas of parents’ knowledge, skills, and behaviors related to their young children. In the Yuma Region, 150 people responded to the 2012 First Things First Family and Community Survey. Among other topics, the survey collected data about parent and caregiver knowledge of children’s early development and their involvement in a variety of behaviors known to contribute positively to healthy development. Parents in the Yuma Region were less likely to report reading to their children (35%), telling stories to their children (42%), and drawing with their child (34%) six or seven days a week compared to families across the state (51%, 51% and 47%, respectively) (see Figure 16, Figure 17, and Figure 18). Over three-quarters of parents (83%) in the Yuma Region showed an understanding that brain development can be impacted prenatally or right from birth, similar to respondents across the state as a whole (see Figure 19).

Communication, Public Information and Awareness

Why it Matters

To create a strong, comprehensive, and sustainable early childhood system, communities need an awareness of the importance of the first five years in a child’s life, and a commitment to align priorities and resources to programs and policies affecting these first years. Supporting public awareness by providing accessible information and resources on early childhood development and health, and educating community members about the benefits of committing resources to early childhood, are key to supporting and growing this system. Assessing the reach of these educational and informational efforts in First Things First regions across the state can help early childhood leadership and stakeholders refine, expand or re-direct these efforts.

What the Data Tell Us

In addition to measuring parent knowledge, skills, and behaviors related to their young children, the 2012 First Things First Family and Community Survey collected data on parents’ perceptions regarding resources available to young children and their families across Arizona. Eighty-four percent of responding parents in the Yuma Region indicated they were “very” or “somewhat satisfied” with “the community information and resources available to them about their children’s development and health” compared to 78 percent of respondents across the state (see Figure 20). While parents found the information satisfactory, 30 percent of Yuma parents reported some difficulty in locating needed or desired services (see Figure 21).

Systems Coordination among Early Childhood Programs and Services

Why it Matters

Through system-building, First Things First is focused on developing approaches to connect various components of the early childhood system. This is done in an effort to create a more holistic system that operates to promote shared results for children and families. Agencies that work together and achieve a high level of coordination and collaboration are often easier for families to access and the services provided are more responsive to the needs of the families. Coordination efforts may also result in an increased capacity to deliver services because of the work that organizations do to identify and address gaps in the service delivery continuum. By supporting a variety of coordination efforts, First Things First aims to create a high quality, interconnected, and comprehensive early childhood service delivery system that is timely, culturally responsive, family driven, community based, and directed toward enhancing children's overall development. Determining how these efforts are impacting regions and the families within them can help inform service, program and policy decisions that will benefit families and young children across the state.

What the Data Tell Us

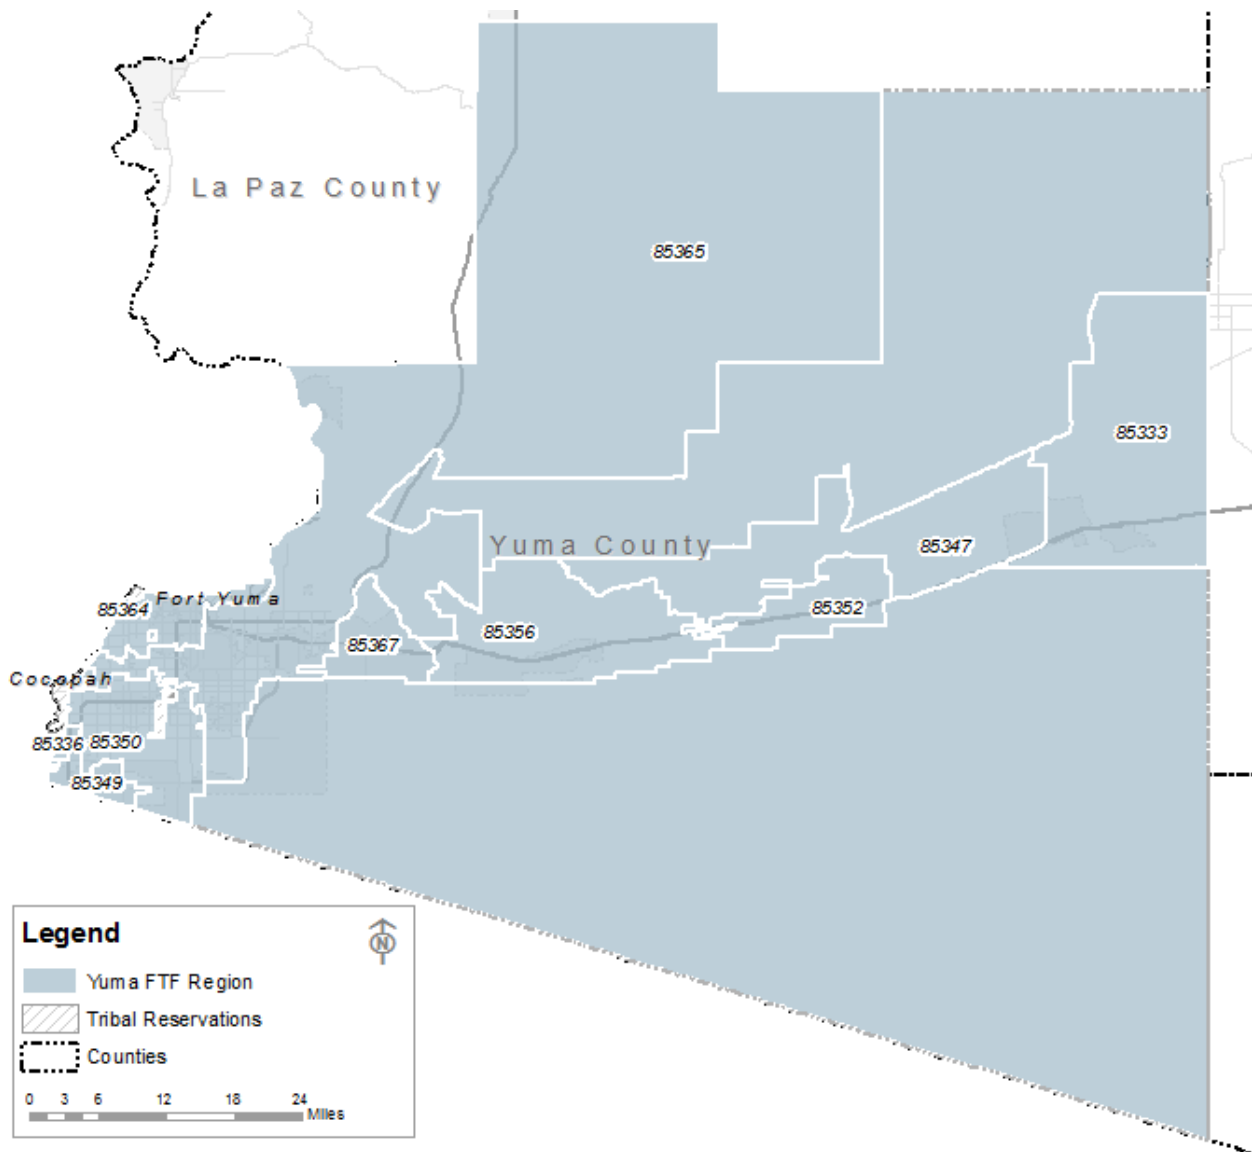

The 2012 First Things First Family and Community Survey also collected data on parents' perceptions regarding how well agencies that serve young children and their families coordinate and collaborate. One item from the 2012 Family and Community Survey addresses the issue of perceived early childhood system coordination. Respondents in both the Yuma Region and the state were more likely to indicate satisfaction (43% in the region and the state) than dissatisfaction (29% in both the region and the state) with how care providers and government agencies work together and communicate (see Figure 22).
