Introduction

Ninety percent of a child's brain growth occurs before kindergarten and the quality of a child's early experiences impacts whether their brain will develop in positive ways that promote learning. First Things First (FTF) was created by Arizonans to help ensure that Arizona children have the opportunity to arrive at kindergarten prepared to be successful. Understanding the critical role the early years play in a child's future success is crucial to our ability to foster each child's optimal development and, in turn, impact all aspects of wellbeing of our communities and our state.

This Needs and Assets Report for the FTF Pima North Region helps community leaders and decision-makers understand the needs of young children in the region, the resources available to meet those needs and gaps that may exist in those resources. Data collection and analysis for the 2020 report were completed prior to the COVID-19 pandemic and, therefore, do not reflect the impact of COVID-19 on families with young children and the services that support them. FTF will continue to work with state agency partners, and, to the extent that data regarding this impact becomes available, it will be included in future Needs and Assets reports. The report is organized by topic areas pertinent to young children in the region, such as the population characteristics or educational indicators. Within each topic area are sections that set the context for why the data found in the topic areas are important (Why it Matters), followed by a section that includes available data on the topic (What the Data Tell Us).

The FTF Pima North Regional Partnership Council recognizes the importance of investing in young children and ensuring that families and caregivers have options when it comes to supporting the healthy development of young children in their care. It is our sincere hope that this information also will help guide community conversations about how we can best support school readiness for all children in the Pima North Region. To that end, this information may be useful to stakeholders in the area as they work to enhance the resources available to young children and their families and as they make decisions about how best to support children birth to 5 years old in communities throughout the region.

Acknowledgements

The Pima North Regional Council wants to thank the Arizona Department of Economic Security, the Arizona Department of Health Services, the Arizona Department of Education and the U.S. Census Bureau, for their contributions of data for this report and their ongoing support and partnership with FTF on behalf of young children.

To the current and past members of the Pima North Regional Council, your vision, dedication and passion have been instrumental in improving outcomes for young children and families within the region. Our future efforts will build upon those successes with the ultimate goal of building a comprehensive early childhood system for the betterment of young children within the region and the entire state.

LETTER FROM THE CHAIR

May 8, 2020

Message from the Chair:

Since the inception of First Things First, the Pima North Regional Partnership Council has taken great pride in supporting evidence-based and evidence informed early childhood programs that are improving outcomes for young children. Through both funded and unfunded approaches, the early childhood programs and services supported by the regional council have strengthened families, improved the quality of early learning, and enhanced the health and well-being of children birth to 5 years old in our community.

This impact would not have been possible without data to guide our discussions and decisions. One of the primary sources of that data is our regional Needs and Assets report, which provides us with information about the status of families and young children in our community, identifies the needs of young children, and details the supports available to meet those needs. Along with feedback from families and early childhood stakeholders, the report helps us to prioritize the needs of young children in our area and determine how to leverage First Things First resources to improve outcomes for young children in our communities.

The Pima North Regional Council would like to thank our Needs and Assets vendor, University of Arizona, for their knowledge, expertise and analysis of the Pima North region. Their partnership has been crucial to our development of this report and to our understanding of the extensive information contained within these pages.

As we move forward, the First Things First Pima North Regional Partnership Council remains committed to helping more children in our community arrive at kindergarten prepared to be successful by funding high-quality early childhood services, collaborating with system partners to maximize resources, and continuing to build awareness across all sectors of the importance of the early years to the success of our children, our communities and our state.

Thanks to our dedicated staff, volunteers and community partners, First Things First has made significant progress toward our vision that all children in Arizona arrive at kindergarten healthy and ready to succeed.

Thank you for your continued support.

Sincerely,

Dr. Susan Shinn, Chair

Executive Summary

Regional Description

The First Things First Pima North Region is defined as the northern portion of Pima County, not including the lands belonging to the Pascua Yaqui Tribe and the Tohono O’odham Nation. The border between the Pima North and Pima South Regions is irregular, but it primarily follows Kinney Road, Ajo Way, and Irvington Road. The region includes the city of South Tucson, the towns of Oro Valley and Marana, and the unincorporated communities of Catalina Foothills, Tanque Verde, Picture Rocks, Catalina, Avra Valley, and Nelson. The Pima North Region does not include the Redington area in the northeastern corner of Pima County, which is assigned to the Cochise Region.

Population Characteristics

According to the U.S. Census, the Pima North Region had a population of 697,919 in 2010, of whom 48,064 (7%) were children ages birth to 5. Twelve percent of households in the region included a young child. This is a lower proportion of households than both the county (14%) and the state (16%). Population projections for Pima County show that the population of young children (ages 0-5) is projected to be about 68,522 by 2020, a decrease from 2010 (74,796). Projections show an increase in the count of young children over time in the county until 2040 (73,870), followed by a slight decline until 2050.

A quarter (25%) of adults and about half (47%) of young children (ages 0-4) in the Pima North Region are Hispanic. These proportions are lower than Pima County as a whole, where two-thirds (66%) of adults and a majority of young children are Hispanic (53%). The region also has a lower percentage of American Indian young children (3%) than the county (5%) and state (6%). The proportions of adults (3%) and young children (5%) who are Black or African American in the region are similar to rates in the county and state, though notably lower than the United States overall (12% and 14%, respectively). The percentages of Asian or Pacific Islander adults (3%) and young children (3%) in the Pima North Region similarly mirror the county and state but are lower than national proportions (5% and 5%, respectively). The race and ethnicity of mothers giving birth in the Pima North Region mirror the county overall. The proportion of births to mothers who are Hispanic or Latina is slightly higher in the region (46%) and county (48%) than in the state overall (41%).

About a quarter (24%) of young children in Pima North live with one or two foreign-born parents; this is comparable to the county as a whole (24%) and only slightly lower than the state overall (26%). Household language use also reflects these demographic patterns; a smaller proportion of individuals speak a language other than English at home in the Pima North Region (25%) than the county (29%) and state overall (27%). However, there are comparable percentages of limited-English-speaking households in the region, county, and state (4% in each).

A majority of children living in the Pima North Region live in two-parent households; 58 percent of young children in the region live with two parents or stepparents, compared to 56 percent in the county and 59 percent in Arizona. More than one-quarter (28%) of households with young children in the region are single-female households, a higher proportion than the state overall (24%). The percentage of young children living in a grandparent's household is slightly lower for the region (12%) compared to the county (14%) and state (14%), though the percentage of children living with a grandparent who is responsible for them is comparable between region, county, and state.

Economic Circumstances

Nearly one of every five (18%) individuals in the Pima North Region and Pima County lives in poverty, a similar proportion to the state (17%). When it comes to young children, over one in four (27%) lives in poverty in the Pima North Region. While this percentage is higher than that of the total (all-age) population in the region living in poverty (18%), it is similar to that of children age 0-5 living in poverty across the county (28%) and state (26%).

Across household types, median annual family income is lower in Pima County than in Arizona and the United States. Median income for married couple families with children in Pima County (\$77,109) is more than three times the median income for single female headed families (\$24,894).

Eligibility for some public assistance programs is determined by different poverty thresholds. For example, family income at or below 141 percent of the federal poverty threshold is one criterion for eligibility for the Arizona Health Care Cost Containment System (AHCCCS)ⁱ for children ages 1 to 5, and at or below 147 percent of the federal poverty threshold for children under 1 year old.¹ In the Pima North Region, the percentage of families with young children who may qualify for AHCCCS (those under 130% of FPL and between 130% and 149% of FPL) (41%) is slightly higher than the state overall (38%).

Between 2015 and 2018, the number of families and young children receiving Temporary Assistance for Needy Families (TANF) declined. In 2018, participation of young children in TANF was low for the region (5%), county (5%), and state (3%). While participation in the Supplemental Nutrition Assistance Program (SNAP) by families and young children also declined between 2015 and 2018, participation in SNAP was still relatively high in the region for families (41%) and young children (44%), with comparable participation in the county and state. Since the 2015-2016 school year, the percentage of students eligible for free or reduced-price lunch in the Pima North Region has steadily declined, from 58 percent in 2015-2016 to 52 percent in 2018-2019.

Rates of adult employment in Pima North (55%) mirror rates of the county (54%) and state (55%) but are lower than the US as a whole (59%). Between 2015 and 2018, rates of

ⁱ Arizona Health Care Cost Containment System (AHCCCS) is the name of Arizona's Medicaid program, which offers health care programs to Arizona residents.

unemployment in Pima County steadily declined, from six percent in 2015 to five percent in 2018. Two-thirds (66%) of households with young children have all present parents in the labor force in the Pima North Region. The percentage of young children living with one parent who is not in the labor force is slightly lower in the region (8%) compared to the state (10%).

About one-third (34%) of households in the region are spending 30 percent or more of their income on housing, a proportion comparable at the county, state, and national levels.

About two-thirds (67%) of households in the region have both a smartphone and computer, mirroring state (67%) and national (66%) numbers. The majority (85%) of Pima North Region residents live in households with a computer and internet. This is slightly higher than state (82%) and national (83%) proportions. For children specifically, household access to a computer and internet in the region is even higher (88%). Of people living in households with a computer and internet in the region, ten percent rely solely on a cellular data plan.

Educational Indicators

In the 2018-2019 school year, 1,706 children were enrolled in preschool in the Pima North Region. Kindergarten through 3rd grade enrollments for the region were all relatively similar, ranging from 6,666 in kindergarten to 6,859 in 3rd grade. Kindergarten through 3rd grade chronic absence ratesⁱⁱ steadily increased from 2015-2016 to 2018-2019 at the regional, county, and state level. During the 2018-2019 school year, the Pima North Region had a 13 percent chronic absence rate, with 4,404 kindergarten through 3rd grade students in the region chronically absent. By grade level, chronic absences ranged from 8 percent to 16 percent in the Pima North Region. In the region and county, chronic absences were highest among 1st grade students (16% and 17%, respectively), while state-level chronic absences were highest among kindergarteners (13%).

Fewer than half of 3rd grade students are meeting proficiency expectations for 3rd grade literacy. Slightly more than half are meeting proficiency expectations for math. Arizona's Measurement of Educational Readiness to Inform Teaching (AzMERIT) 3rd Grade English Language Arts passing rates for the Pima North Region (44%) mirrored statewide passing rates in 2017-2018 and have remained relatively constant over time at the region, county, and state levels.

AzMERIT 3rd Grade Math passing rates for the Pima North Region (53%) also mirrored statewide passing rates in 2017-2018. AzMERIT 3rd Grade Math passing rates have improved over time at the region, county, and state level, with regional passing rates increasing from 48 percent in 2015-2016 to 53 percent in 2017-2018.

In 2017, the the Pima North Region had a four-year high school graduation rate of 74 percent and a five-year graduation rate of 80 percent. Since 2015, both the four-year and five-year

ⁱⁱ Chronic absenteeism is defined as missing more than 10 percent of the school days within a school year.

graduation rates have declined in the Pima North Region. The 7th-12th grade dropout rate for Pima North increased from 4 percent in 2015-2016 to 6 percent in 2017-2018.

A larger proportion of adults have more than a high-school education in the Pima North Region (69%) than in Pima County (66%), Arizona (62%), and the United States overall (60%). This difference is also seen specifically in mothers giving birth, with a larger proportion of births to mothers with more than a high-school education in the Pima North Region (61%) than the county (57%) and state (56%).

Early Learning

In the Pima North Region, 43 percent of children (ages 3 and 4) are enrolled in nursery school, preschool, or kindergarten. While this is a larger proportion than the county (40%) and state (38%), it is lower than the national proportion (48%). In the Pima North Region, nearly all (97%) of licensed child care capacity is provided by child care centers, with a small proportion provided by family child care providers (3%) and nannies/individual providers (<1%). The Pima North Region has a higher percentage of providers who are accredited (16%) than the state (10%), as well as a higher percentage of potential child care slots (provider capacity) with accredited providers (19%) than the state (12%).

Median monthly child care costs for certified group homes and licensed centers are similar across the region, county, and state. However, median costs for approved family homes are as much as \$100 more per child per month in the Pima North Region compared to the state. Overall, licensed centers are the most expensive and approved family homes the least expensive for all ages in the region. Child care costs are relatively more expensive in Pima County than in the state overall. At median levels, sending an infant to a licensed center requires over one-sixth (17%) of a family's income. Given that one in five Pima North Region residents lives in poverty and one-third of Pima North Region households are spending 30 percent or more of their income on housing, this is a notable proportion of income needed to cover child care for families that may already have difficulty meeting their basic needs.

Nearly all (95%) children who are not involved with the Department of Child Safety (DCS) and are eligible for Department of Economic Security (DES) child care subsidies in the Pima North Region have received them in recent years. This proportion is slightly higher than the state overall, with 92 percent of eligible children receiving child care subsidies in 2018 statewide. For DCS-involved children specifically, the proportion of eligible children receiving subsidies in the region is lower than for all eligible children and has declined over time, from 92 percent in 2015 to 86 percent in 2018. This decline in DCS-involved children receiving subsidies was also seen at a state level, with 82 percent of DCS-involved children receiving subsidies in Arizona in 2018 compared to 91 percent in 2015. The proportion of eligible families not using DES child care subsidies has increased slightly over time at the region, county, and state level. In 2018, five percent of eligible families in the Pima North Region did not use their child care subsidies.

Quality educational environments are defined by the Department of Economic Security (DES) as providers that are accredited by a national organization or providers that have received a state-approved quality indicator that is recognized by the department.ⁱⁱⁱ From 2017 to 2018, the number of children receiving subsidies in quality environments, and particularly the number of DCS children in quality environments, increased at the regional, county, and state levels. In 2019, a total of 135 child care providers in the Pima North Region participated in Quality First, 74 percent of which were quality-level settings (public 3-5 stars). Of the 7,395 children enrolled at a Quality First provider site in the region, 75 percent were enrolled at a quality-level setting (public 3-5 stars). In 2019, 950 children received Quality First scholarships.

As an alternative to expulsion, early education providers in Arizona have an opportunity to identify young children as being at risk for expulsion and to receive consultation from experts to help intervene in problem behaviors. Consultation is provided through on-site mental health consultation, available for Quality First and some non-Quality First providers, as well as through a Department of Economic Security (DES)-managed hotline. If that child is then able to remain in the center, this is documented as a prevented expulsion and their case is closed out. In 2018, eleven early childhood expulsions of young children receiving child care subsidies were reported as prevented to DES in Pima County.

The number of young children (ages 3-5) enrolled in special education increased slightly from 2015-2016 (1,354) to 2018-2019 (1,387) in the Pima North Region. The largest proportion of young children (ages 3-5) enrolled in special education in the region were diagnosed with a speech or language impairment (44%) or developmental delay (39%). Special education enrollment for 1st through 3rd grade students has continued to increase in the region since 2015-2016 (13%), with 15 percent of children in 1st through 3rd grades enrolled in special education in 2018-2019.

From 2016 to 2017, the percentage of children (ages 0-2) who were referred to the Arizona Early Intervention Program (AzEIP) and found eligible increased from 55 percent to 60 percent in the Pima North Region. From 2017 to 2018, the number of active AzEIP cases in the Pima North Region increased by four percent. The number of children receiving services from the Division of Developmental Disabilities (DDD) has increased over time at the region, county, and state levels since 2015. From 2015 to 2018, children ages 0-2 receiving DDD services in the Pima North Region increased by 25 percent and children ages 3-5 receiving DDD services increased by 70 percent.

Child Health

In the Pima North Region, about one in ten (10%) people do not have health insurance coverage, a number that aligns with the nation (10%) but is slightly lower than the state of

ⁱⁱⁱ Providers are considered quality educational environments by the Arizona Department of Economic Security if they receive a Quality First three-star rating or higher or are accredited by a national organization, such as the Association for Early Learning Leaders or the National Association for the Education of Young Children (NAEYC).

Arizona overall (12%). For young children specifically, health insurance coverage is slightly better than the overall population in the region but worse than coverage nationally, with seven percent of young children uninsured in the Pima North Region compared to four percent of young children uninsured nationally. Almost half of births (48%) in the Pima North Region were covered by AHCCCS^{iv} in 2017, a percentage lower than the state average (53%). The proportion of births covered by the Indian Health Service (IHS) and self-paid births were comparable across the region, county, and state in 2017.

The Pima North Region had lower rates of prenatal care than Arizona as a whole, with a larger proportion of births to mothers who had no prenatal care at all (6%), no prenatal care in the first trimester (31.4%), and fewer than five visits if they did have prenatal care (12.2%) compared to state averages (2.9%, 26.4%, and 7.5% respectively). Neither the region nor the state met the Healthy People 2020 target of at least 77.9 percent of births to mothers who received prenatal care in the first trimester.

The proportion of babies born at low birth weight was slightly higher in Pima North (7.6%) than the county (7.2%) and state (7.5%) in 2017, though it still met the Healthy People 2020 target of no more than 7.8 percent. For rates of preterm birth, the Pima North Region, along with the county and state, met the Healthy People 2020 target of no more than 9.4 percent of births before 37 weeks gestation. The Pima North Region did not meet the Healthy People 2020 target for maternal use of tobacco during pregnancy (1.4%), with 6.4 percent of births to mothers using tobacco while pregnant. In 2017, Pima County had an infant mortality rate (3.9 per 1,000 live births) that met the Healthy People 2020 target (6.0 per 1,000 live births) and was lower than the state average (5.6 per 1,000 live births).

In 2016 and 2017, the rate of neonatal abstinence syndrome (i.e., opioid-addicted babies) in Pima County (14.3 per 1,000 live births) was almost twice the state average (7.4 per 1,000 live births). Between June 2017 and June 2018, there were 1,431 suspected opioid overdoses among people of all ages in Pima County. In 2017, there were 176 deaths directly attributed to opioids in Pima County; this accounted for nearly one-in-five (19%) opioid-related deaths across the state.

In Pima County, rates of breastfeeding for infants in the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) were slightly higher than the state rates. While 80 percent of WIC infants were breastfed at some point in infancy, rates of breastfeeding decline with the baby's age. Although the American Academy of Pediatrics recommends exclusive breastfeeding until six months of age, at six months of age, only 28 percent of infants were breastfed and only 4 percent were ever exclusively breastfed in Pima County. Even at three months old, exclusive breastfeeding for WIC infants in Pima County was low (16%).

Across all required immunizations, with the exception of hepatitis A, children in child care in the Pima North Region had higher vaccination rates than the state as a whole and met the Healthy

^{iv} AHCCCS is Arizona's Medicaid agency

People 2020 targets during the 2018-2019 school year. The region also exceeded statewide immunization rates and met all Healthy People 2020 targets for kindergarten immunizations during this time.

In terms of immunization exemptions among children in child care, between 2016 and 2019 the region had lower rates of children in child care receiving religious exemptions and exemptions from all required vaccines than the state. During the 2018-2019 school year, 2.3 percent of children in child care received a religious exemption in Pima North compared to 4.5 percent of children statewide, and 1.6 percent of children in child care received exemptions from all required vaccines in Pima North compared to three percent of children statewide. The Pima North Region also had lower rates of children in kindergarten receiving personal belief exemptions and exemptions from all required vaccinations than statewide averages between 2016 and 2019. During the 2018-2019 school year, 4.1 percent of children in kindergarten received a personal belief exemption in Pima North compared to 5.9 percent of children statewide, and 2.5 percent of children in kindergarten received exemptions from all required vaccines in Pima North compared to 3.8 percent statewide.

Reasons for non-fatal hospitalizations of young children for unintentional injuries in the Pima North Region aligned with the county and state, with falls (31%) and poisoning (19%) the most common. Reasons for non-fatal emergency room visits were also similar between region, county, and state, with falls (45%) and being 'struck by or against' an object or person (15%) the most common. Between 2015 and 2017, there were 827 emergency room visits and 306 inpatient hospitalizations for asthma for young children in the Pima North Region. The average length of stay for asthma hospitalization (2.4 days) was longer for the Pima North Region than the state (1.9 days). Between 2015 and 2017, there were 174 deaths of children in the Pima North Region, 77 percent of which were in young children (134 deaths). The proportion of child deaths that involved young children was higher in the Pima North Region than in the county (73%) or state (71%).

Family Support and Literacy

In 2019, 445 families in the Pima North Region received First Things First-funded home visitation services, including 28 families who successfully completed and graduated from home visitation programs.

Between January 2018 and June 2018, there were 714 substantiated maltreatment reports in Pima County. Of those substantiated reports, the majority were related to neglect (86%), with a smaller proportion related to physical abuse (12%) and sexual abuse (2%). These proportions mirror the statewide average for Arizona during the same time period. The statewide number of child removals by the Department of Child Safety (DCS) declined from 2014 to 2017. Between January and June 2018, 15 percent of DCS reports resulted in a child removal in Pima County, with 832 children removed. While the percentage of children removed overall was similar between the county and state, there was a higher percentage of children with a prior removal in the last 24 months in Pima County (13%) than the state (9%).

While the number of foster placements declined from 2015 to 2018, the statewide number of licensed foster homes steadily increased during this time.

Systems Coordination among Early Childhood Programs and Services

The Family Engagement Network is creating multi-generational impact in Pima County. The Family Engagement Network is a collaboration between First Things First Pima North and Pima South Regional Partnership Councils, The United Way of Tucson and Southern Arizona, Pima Community College, and Pima County One-Stop. The goal of the Family Engagement Network is to build a collaborative system that mitigates barriers for families in Pima County accessing a workforce development program. The ultimate outcome of this system building is that parents are acquiring higher education and a career in a high-demand field, which will raise them out of poverty while their young children simultaneously have access to high-quality early learning and supports in their most formative years. First Things First Pima North and Pima South Regional Partnership Councils, specifically, build upon this system through their allocation of Quality First Scholarships to support the children birth to age 5 of the parents enrolled in the workforce development program.

The Family Support Alliance was developed in 2009 and is a collaborative effort aimed at creating a coordinated family support system to decrease barriers families may face when accessing supportive services. Through this collaborative, the home visitation programs and oral health program within the regions are collaborating to provide family-centered events that provide engaging activities, oral health screenings, and opportunities for building connections with other families.

Cradle 2 Career is a countywide effort engaging in collective impact to improve educational outcomes for every child in every school to ensure economic vitality for our community. The goals of Cradle to Career are being realized through the work of individual Change Networks focused on conducting research, utilizing data, and tracking the progress to identify effective practices that address the challenges and barriers identified.

Throughout the last two years, community members have been working to develop an initiative to ensure that more 3-4 year olds within the community have access to high quality preschool. This work began within the City of Tucson and provided an opportunity to build increased awareness of the importance of high-quality early care and education as well as the lack of access for families within Pima County. Additionally, this initiative galvanized community leaders to work together to expand those opportunities. The resulting recommendation was The Preschool Promise, an effort to use both private and public dollars to fund preschool for all low-income 3-4-year-olds in the Pima area. The recommendation included the requirement that children supported through the program attend quality early learning settings (as defined by earning 3-5 stars in Quality First) and that the amount of assistance result in no co-pays for families.

Communication, Public Information and Awareness

First Things First regularly measures their progress toward building support for children birth to age 5 through statewide surveys targeting both the general population and parents of young children. Their most recent statewide survey conducted in September 2018 found that, compared to previous surveys in 2012 and 2016, there was increased agreement in the general public and parents of young children with statements about the importance of early childhood health and development. These include: the state should ensure all children have access to early childhood services, a child who received early education and healthcare services before age 5 is more likely to succeed in school and beyond, and the state should put the same priority on early education as it does on K-12 education. While the survey also showed that awareness of First Things First has increased over time, there are still large portions of the general public (87%) and parents of young children (66%) who have never heard of First Things First.

In SFY 2019, First Things First secured 11 million advertising impressions through traditional media strategies, including television, radio, cinema, and billboard ads, and 76 million digital advertising impressions through digital media strategies, including online ads on desktop and smartphone devices. Particular success has been seen in the growth of Facebook Page Likes for FTF, which grew from just 3,000 in 2012 to 142,600 in 2019. Additional digital marketing content in 2019 included 40 original, high-quality digital marketing pieces and the creation of an online searchable database of early childhood programs, which logged over 24,187 visits in its first six months. Specifically in Pima North and Pima South Regions, digital advertising led to a total of 56,334 click-throughs to the FTF website where families could access more information and resources.

Because Arizona is so vast – with more than 500,000 children under age 6 and nearly 400,000 households with kids under age 6 – engaging others in spreading the word about early childhood is critical to reaching across diverse geographic areas and expanding our reach. Supporters and Champions are trained in early childhood messaging and effective ways to share early childhood information, and Pima North Region had 340 Supporters and 57 Champions in SFY19. These Supporters and Champions reported a total of 40 positive actions taken on behalf of young children throughout the Pima North Region in SFY19. These actions range from leading presentations in support of early childhood to sharing FTF's early childhood resources with parents at community events.

First Things First has also led a concerted effort to build awareness among policymakers at all levels (federal, tribal, state, and municipal) of the importance of early childhood. In SFY19, FTF also launched ACT4KIDS, a text-based system that alerts participants to timely developments in early childhood policy and opportunities to engage with policymakers. In its first nine months of implementation, more than 700 Arizonans had signed up to participate in ACT4KIDS. In addition, FTF actively participates in the Arizona Early Childhood Alliance, comprised of more than 50 early childhood system leaders, which represents a united voice of the early childhood community in advocating for early childhood programs and services. For the past three years,

the Alliance has also led an annual Early Childhood Day at the legislature, which draws hundreds of Arizonans to the state Capitol to engage with policymakers and show their support for early childhood development and health.

The Pima North Region

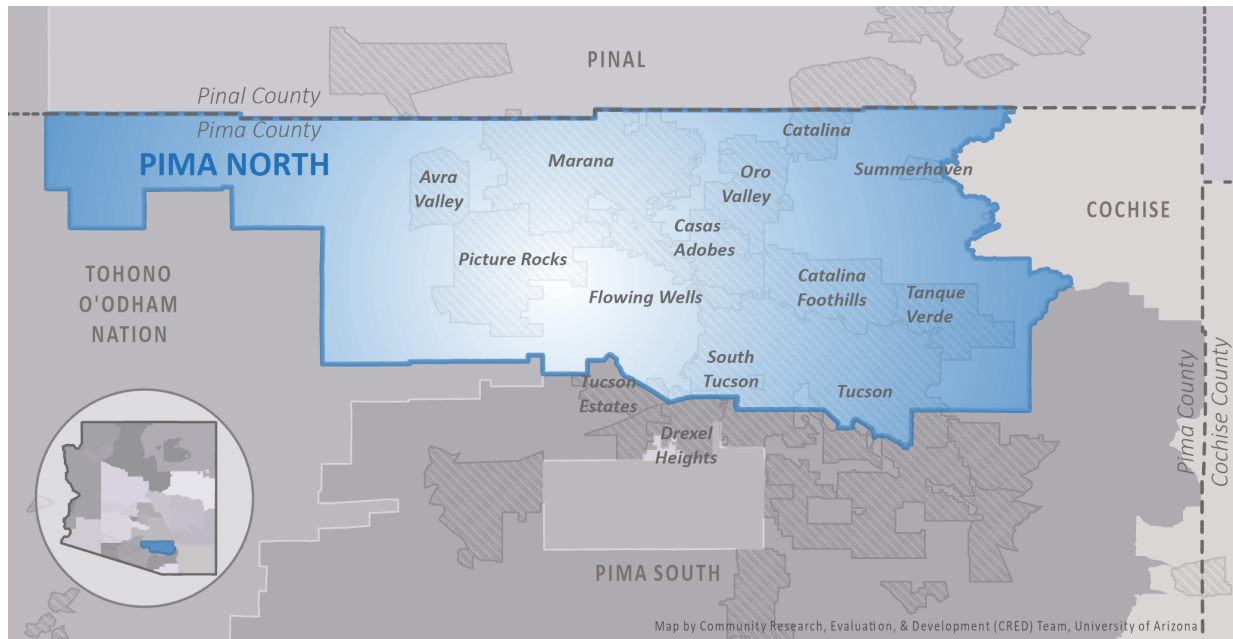

Regional Boundaries

The First Things First regional boundaries were established to create regions that (a) reflect the view of families in terms of where they access services, (b) coincide with existing boundaries or service areas of organizations providing early childhood services, (c) maximize the ability to collaborate with service systems and local governments, (d) facilitate the ability to convene a Regional Partnership Council, and (e) allow for the collection of demographic and indicator data.

The First Things First Pima North Region is defined as the northern portion of Pima County, not including the lands belonging to the Pascua Yaqui Tribe and the Tohono O’odham Nation. The border between the Pima North and Pima South Regions is irregular, but it primarily follows Kinney Road, Ajo Way, and Irvington Road. The region includes the city of South Tucson, the towns of Oro Valley and Marana, and the unincorporated communities of Catalina Foothills, Tanque Verde, Picture Rocks, Catalina, Avra Valley, and Nelson. The Pima North Region does not include the Redington area in the northeastern corner of Pima County, which is assigned to the Cochise Region.

Figure 1 below shows the geographical area covered by the Pima North Region. Additional information available at the end of this report includes a map of the region by zip code in Appendix 1, a table listing zip codes for the region in Appendix 2, and a map of school districts in the region in Appendix 3.

Figure 1. The Pima North First Things First Region

Source: Custom map by the Community Research, Evaluation, & Development (CRED) Team using shapefiles obtained from First Things First and the U.S. Census Bureau 2019 TIGER/Line Shapefiles (<https://www.census.gov/cgi-bin/geo/shapefiles/index.php>)

Data Sources

The data contained in this report come from a variety of sources. Some data were provided to First Things First by state agencies, such as the Arizona Department of Economic Security (DES), the Arizona Department of Education (ADE), and the Arizona Department of Health Services (ADHS). Other data were obtained from publicly available sources, including the 2010 U.S. Census, the American Community Survey (ACS), the Arizona Department of Administration (ADOA), and the Department of Child Safety (DCS).

The U.S. Census² is an enumeration of the population of the United States. It is conducted every ten years, and includes information about housing, race, and ethnicity. The 2010 U.S. Census data are available by census block. There are about 115,000 inhabited blocks in Arizona, with an average population of 56 people each. The Census data for the Pima North Region presented in this report were calculated by identifying each block in the region and aggregating the data over all of those blocks.

The American Community Survey³ is a survey conducted by the U.S. Census Bureau each month by mail, telephone, and face-to-face interviews. It covers many different topics, including income, language, education, employment, and housing. The ACS data are available by census tract. Arizona is divided into about 1,500 census tracts, with an average of about 4,200 people in each. The ACS data for the Pima North Region were calculated by aggregating over the census tracts which are wholly or partially contained in the region. The data from partial census tracts were apportioned according to the percentage of the 2010 Census population in that

tract living inside the Pima North Region. The most recent and most reliable ACS data are averaged over the past five years; those are the data included in this report. They are based on surveys conducted from 2013 to 2017. In general, the reliability of ACS estimates is greater for more populated areas. Statewide estimates, for example, are more reliable than county-level estimates.

To protect the confidentiality of program participants, the First Things First Data Dissemination and Suppression Guidelines preclude our reporting social service and early education programming data if the count is less than ten and preclude our reporting data related to health or developmental delay if the count is less than six. In addition, some data received from state agencies may be suppressed according to their own guidelines. The Arizona Department of Health Services does not report counts less than six; the Arizona Department of Economic Security does not report counts between one and nine; and the Arizona Department of Education does not report counts less than eleven. Throughout this report, information which is not available because of suppression guidelines will be indicated by entries of “<6” or “<10” or “<11” for counts, or “DS” (data suppressed) for percentages. Data are sometimes not available for particular regions, either because a particular program did not operate in the region or because data are only available at the county level. Cases where data are not available will be indicated by an entry of “N/A.”

For some data, an exact number was not available because it was the sum of several numbers provided by a state agency, and some numbers were suppressed in accordance with agency guidelines. In these cases, a range of possible numbers is provided, where the true number lies within that range. For example, for data from the sum of a suppressed number of children ages 0-12 months, 13 children ages 13-24 months, and 12 children ages 25-35 months, the entry in the table would read “26 to 34.” This is because the suppressed number of children ages 0-12 months is between one and nine, so the possible range of values is the sum of the two known numbers plus one to the sum of the two known numbers plus nine. Ranges that include numbers below the suppression threshold of less than six or ten may still be included if the upper limit of the range is above six or ten. Since a range is provided rather than an exact number, the confidentiality of program participants is preserved.

Population Characteristics

Why it Matters

To support the healthy development and learning of young children across Arizona, advocates and decision makers need to understand who those children and their families are.⁴ Although parents are a child's first and most important teachers, families of young children often use community resources to help them promote positive outcomes for their children.⁵ The number and characteristics of young children and families in a region can inform the range of services needed in a community, helping to guide where to locate child care, health care, and social services so that they are accessible to those who need them.^{6,7}

Immigrant families. Families in the US are becoming more diverse. Knowing how local communities are changing can help ensure families have access to the services and supports they need to thrive.⁸ Children of foreign-born parents represent one of the fastest growing groups of young children in the country.⁹ Recent changes in national immigration policy have led some immigrant families to avoid using social services for which they legally qualify due to fear of deportation or jeopardizing their legal status in the country.^{10,11,12} Policy changes at a national level, such as the “public charge rule”^v set to be enacted in October 2019, may deter families – particularly those with a recent history of immigration – from using available supports for which they legally qualify.^{13,14} Children in these families may be at particular risk of reduced access to medical care and increased food insecurity.^{15,16,17}

Language use. Households with multiple languages spoken pose a unique balance of benefits for child learning and barriers to parental engagement, which counties with high rates of other languages spoken should specifically consider. Acknowledging and valuing linguistic heritage (such as through language preservation efforts) and recognizing needs for resources and services in languages other than English should remain important considerations for organizations and agencies across Arizona.^{18,19,20,21} Awareness of the levels of English proficiency and of other home languages spoken within a region provides information about a community's assets and allows for identifying relevant supports. Young children can benefit from exposure to multiple languages; mastery of more than one language is an asset in school readiness and academic achievement and offers cognitive and social-emotional benefits in early school and throughout their lifetime.^{22,23,24,25} Although dual language learning is an asset, limited English speaking households (that is, households where none of the adult members speak English well) can face challenges. These families may experience barriers to accessing health care and social service information, as well as barriers to engaging in important parent-teacher interactions, all of which can impede their child's health and development.^{26,27} Providing information about resources and services in languages accessible to families in the

^v U.S. Citizenship and Immigration Services defines “public charge” as an individual who is likely to become “primarily dependent on the government for subsistence, as demonstrated by either the receipt of public cash assistance for income maintenance, or institutionalization for long-term care at government expense.”

region can help remove those barriers. Although Spanish is the most common second language spoken, Arizona is also home to a large number of Native communities, with Native languages spoken by families in those communities. Language preservation and revitalization are critical to strengthening culture in Native communities, addressing issues of educational equity, and to the promotion of social unity, community well-being, and Indigenous self-determination.^{28, 29} Special consideration should be given to respecting and supporting the numerous Native American languages spoken, particularly in tribal communities around the state.

Family and household composition. In addition to growing racial, ethnic and social diversity, US and Arizona families are becoming more diverse in terms of family structure.^{30,31,32,33} Understanding the makeup of families in a region can help better prepare child care, school and agency staff to engage with families in ways that support positive interactions both within families and with staff to enhance each child's early learning and development.³⁴

Multi-generational households, particularly those where grandparents live in the home with the child and parents, are traditional in some communities and cultures and can provide financial and social benefits.³⁵ However, parents are not always in the picture in these homes. Care of children by someone other than their parents, such as relatives or close friends, is known as kinship care and is increasingly common.³⁶ Children living in kinship care can arrive in those situations for a variety of reasons, including a parent's absence for work or military service, chronic illness, drug abuse, or incarceration, or due to abuse, neglect, or homelessness. Understanding who is caring for children can help in identifying and creating specific supports for these families. Children in kinship care often face special needs as a result of trauma, and therefore these families often require additional support and assistance to help children adjust and provide the best possible home environment.³⁷ A child's risk of living in poverty is also higher for those living with grandparents, adding to the family stress.³⁸ These families are likely to require access to information on resources, support services, benefits, and policies available to aid in their caregiving role.³⁹

What the Data Tell Us

Population, Race, and Ethnicity

- According to the U.S. Census, the Pima North Region had a population of 697,919 in 2010, of whom 48,064 (7%) were children ages birth to 5. Twelve percent of households in the region included a young child. This is a lower proportion of households than both the county (14%) and the state (16%) (Table 1).
- Population projections for Pima County show that the population of young children (ages 0-5) is projected to be about 68,522 by 2020, a decrease from 2010 (74,796). Projections show an increase in the count of young children over time in the county until 2040 (73,870), followed by a slight decline until 2050 (Figure 2).
- A quarter (25%) of adults and about half (47%) of young children (ages 0-4) in the Pima North Region are Hispanic. These proportions are lower than Pima County as a whole, where two-thirds (66%) of adults and a majority of young children are Hispanic (53%). The region also has a lower percentage of American Indian young children (3%) than the county (5%) and state (6%). The proportions of adults (3%) and young children (5%) who are Black or African American in the region are similar to rates in the county and state, though notably lower than the United States overall (12% and 14%, respectively). The percentages of Asian or Pacific Islander adults (3%) and young children (3%) in the Pima North Region similarly mirror the county and state but are lower than national proportions (5% and 5%, respectively) (Table 3 & Table 4).
- The race and ethnicity of mothers giving birth in the Pima North Region mirror the county overall. The proportion of births to mothers who are Hispanic or Latina is higher in the region (46%) and county (48%) than in the state overall (41%) (Table 5).

Immigrant Families and Language Use

- About a quarter (24%) of young children in Pima North live with one or two foreign-born parents; this is comparable to the county as a whole (24%) and only slightly lower than the state overall (26%) (Table 6).
- Household language use also reflects these demographic patterns; a smaller proportion of individuals speak a language other than English at home in the Pima North Region (25%) than in the county (29%) and state overall (27%). However, there are comparable percentages of limited-English-speaking households in the region, county, and state (4% in each) (Table 7 & Table 9).

Family and Household Composition

- A majority of children living in the Pima North Region live in two-parent households; 58 percent of young children in the region live with two parents or stepparents, compared to 56 percent in the county and 59 percent in Arizona (Table 10).
- More than one-quarter (28%) of households with young children in the region are single-female households, a higher proportion than the state overall (24%) (Table 11).
- The percentage of young children living in a grandparent's household is slightly lower for the region (12%) compared to the county (14%) and state (14%), though the percentage of children living with a grandparent who is responsible for them is comparable between region, county, and state (Table 12 & Table 13).

Note: This table includes both (a) grandchildren living with grandparents with no parent present and (b) grandchildren who live in multigenerational homes where the grandparent has assumed responsibility for the child, despite the presence of a parent.

Economic Circumstances

Why it Matters

A family's economic stability is a powerful predictor of child well-being and is one of the key social determinants of health.⁴⁰ Factors contributing to economic stability – or lack thereof – include **poverty, food insecurity, employment, and housing instability.**⁴¹

Poverty. Childhood poverty can negatively affect the way children's bodies grow and develop, including fundamental changes to the architecture of the brain.⁴² Children raised in poverty are at a greater risk of a host of negative outcomes including low birth weight, lower school achievement, and poor health.^{43,44,45,46,47} They are also more likely to remain poor later in life.^{48,49} As a benchmark, the 2019 Federal Poverty Guideline – the criterion used for establishing eligibility for some safety net programs – for a family of four was \$25,750.⁵⁰ However, the federal poverty guideline definition of poverty was developed in the 1950s, and estimates only what a family would need to earn to afford basic nutrition, without taking into account other costs of living; it is widely considered to be well below what a family actually needs to earn to make ends meet. The “self-sufficiency standard” attempts to estimate how much families need to earn to fully support themselves, accounting for local costs of housing, transportation, and child care, and other budget items.⁵¹ The 2018 self-sufficiency standard for an Arizona family with two adults, one preschooler, and one school-age child was \$56,143 – over twice the poverty threshold.⁵²

Public assistance programs are one way of counteracting the effects of poverty and providing supports to children and families in need. The Temporary Assistance for Needy Families (TANF) Cash Assistance program provides temporary cash benefits and support services to children and families. Eligibility is based on citizenship or qualified resident status, Arizona residency, and limits on resources and monthly income.

Food insecurity. A limited or uncertain availability of food is negatively associated with many markers of health and well-being for children, including heightened risks for developmental delays⁵³ and being overweight or obese.⁵⁴ To help reduce food insecurity, there are a variety of federally-funded programs including the Supplemental Nutrition Assistance Program (SNAP),⁵⁵ the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC),⁵⁶ the National School Lunch Program,⁵⁷ the School Breakfast Program,⁵⁸ the Summer Food Service Program,⁵⁹ and the Child and Adult Care Food Program (CACFP).⁶⁰ However, only about 58 percent of food insecure households nationwide report participating in federally-funded nutrition assistance programs.⁶¹

SNAP. Administered by the Arizona Department of Economic Security and also referred to as “Nutrition Assistance” and “food stamps,” SNAP has been shown to help reduce hunger and improve access to healthier food.⁶² SNAP benefits support working families whose incomes simply do not provide for all their needs. For low-income working families, the additional funds available to access food from SNAP can help make a meaningful difference. For example, for a

three-person family with one person who earns a minimum wage, SNAP benefits can boost take-home income by 10-20 percent.⁶³

WIC. Administered by the Arizona Department of Health Services, this federally-funded program serves pregnant, postpartum, and breastfeeding women, as well as infants and young children (under the age of five) who are economically disadvantaged (i.e., family incomes at or below 185 percent of the federal poverty level). The program offers funds for nutritious food, breastfeeding and nutrition education, and referrals to health and social services.⁶⁴

Participation in WIC has been shown to be associated with healthier births, lower infant mortality, improved nutrition, decreased food insecurity, improved access to health care, and improved cognitive development and academic achievement for children.⁶⁵

National School Lunch Program. Administered by the Arizona Department of Education, the National School Lunch Program provides free and reduced-price meals at school for students whose family incomes are at or less than 130 percent of the federal poverty level for free lunch, and 185 percent of the federal poverty level for reduced-price lunch.

Employment. Unemployment and underemployment can affect a family's ability to meet the expenses of daily living, as well as their access to resources needed to support their children's well-being and healthy development. A parent's job loss can affect children's school performance, leading to poorer attendance, lower test scores, and higher risk of grade repetition, suspension, or expulsion.⁶⁶ Unemployment can also put families at greater risk for stress, family conflict, and homelessness.⁶⁷ Note that this does not include persons who have dropped out of the labor force entirely, including those who wanted to but could not find suitable work and so have stopped looking for employment.⁶⁸

Housing instability. Examining indicators related to housing quality, costs, and availability can reveal additional factors affecting the health and well-being of young children and their families in a region. Housing challenges such as issues paying rent or mortgage, overcrowded living conditions, unstable housing arrangements, and homelessness can have harmful effects on the physical, social-emotional, and cognitive development of young children.⁶⁹ Traditionally, housing has been deemed affordable for a family if it costs less than 30 percent of their annual income.⁷⁰ High housing costs, relative to family income, are associated with increased risk for overcrowding, frequent moving, poor nutrition, declines in mental health, and homelessness.^{71,72}

One increasingly critical need for modern homes is a reliable means of internet access. Families often rely on communication and information technologies to access information, connect socially, pursue an education, and apply for employment opportunities. Parents are also more likely to turn to online resources, rather than in-person resources, for information about obtaining health care and sensitive parenting topics including bonding, separation anxiety, and managing parenting challenges.⁷³ The term "digital divide" refers to disparities in communication and information technologies,⁷⁴ and the lack of sustained access to information and communication technologies in low-income communities is associated with economic and

social inequality.⁷⁵ Low-income households may experience regular disruptions to this increasingly important service when they can't pay bills, repair or update equipment, or access public locations that may offer connectivity (e.g., computers at local libraries).⁷⁶ Nationally, Americans are increasingly reliant on smartphones as their sole source of internet access. Particularly for individuals who are younger, lower-income, and non-white, broadband service at home is less common and smartphone-only internet use is more common.⁷⁷ Households in rural areas typically experience more limited coverage from mobile networks and slower-speed internet services, as well as limited internet provider options which can result in higher monthly costs.^{78,79,80}

What the Data Tell Us

Poverty

- Nearly one of every five (18%) individuals in the Pima North Region and Pima County lives in poverty, a similar proportion to the state (17%). When it comes to young children, over one in four (27%) lives in poverty in the Pima North Region. While this percentage is higher than that of the total (all-age) population in the region living in poverty (18%), it is similar to that of children age 0-5 living in poverty across the county (28%) and state (26%) (Figure 3).
- Across household types, median annual family income is lower in Pima County than in Arizona and the United States. Median income for married couple families with children in Pima County (\$77,109) is more than three times the median income for single female headed families (\$24,894) (Table 14).
- Eligibility for some public assistance programs is determined by different poverty thresholds. For example, family income at or below 141 percent of the federal poverty threshold is one criterion for eligibility for the Arizona Health Care Cost Containment System (AHCCCS)^{vi} for children ages 1 to 5, and at or below 147 percent of the federal poverty threshold for children under 1 year old.⁸¹ In the Pima North Region, the percentage of families with young children who may qualify for AHCCCS (those under 130% of FPL and between 130% and 149% of FPL) (41%) is slightly higher than the state overall (38%) (Table 15 & Figure 4).
- Between 2015 and 2018, the number of families and young children receiving Temporary Assistance for Needy Families (TANF) declined. In 2018, participation of young children in TANF was low for the region (5%), county (5%), and state (3%) (Table 16 & Table 17).

Food Insecurity

- While participation in the Supplemental Nutrition Assistance Program (SNAP) by families and young children also declined between 2015 and 2018, participation in SNAP was still relatively high in the region for families (41%) and young children (44%), with comparable participation in the county and state (Table 18 & Table 19).
- Since the 2015-2016 school year, the percentage of students eligible for free or reduced-price lunch in the Pima North Region has steadily declined, from 58 percent in 2015-2016 to 52 percent in 2018-2019 (Table 20).

Employment

- Rates of adult employment in Pima North (55%) mirror rates of the county (54%) and state (55%) but are lower than the US as a whole (59%) (Table 21).
- Between 2015 and 2018, rates of unemployment in Pima County steadily declined, from six percent in 2015 to five percent in 2018 (Figure 5).

^{vi} AHCCCS is Arizona's Medicaid agency

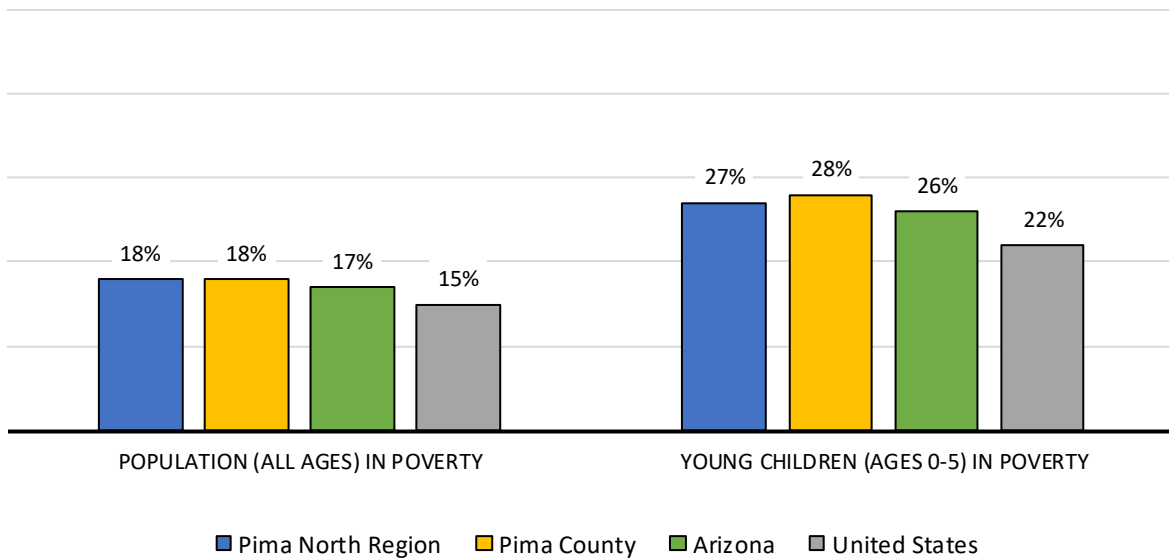

- Two-thirds (66%) of households with young children have all present parents in the labor force in the Pima North Region. The percentage of young children living with one parent who is not in the labor force is slightly lower in the region (8%) compared to the state (10%) (Table 22).

Housing Instability

- About one-third (34%) of households in the Pima North Region are spending 30 percent or more of their income on housing, a proportion comparable at the county, state, and national levels (Table 23).
- About two-thirds (67%) of households in the region have both a smartphone and computer, mirroring state (67%) and national (66%) numbers (Table 24).
- The majority (85%) of Pima North Region residents live in households with a computer and internet. This is slightly higher than state (82%) and national (83%) proportions (Table 25).
- For children specifically, household access to a computer and internet in the region is even higher (88%) (Table 26).
- Of people living in households with a computer and internet in the region, ten percent rely solely on a cellular data plan (Table 27).

Educational Indicators

Why it Matters

Measures of educational engagement and achievement in a community have important implications for the developmental and economic resources available to children and families in that region. Individuals with higher levels of education tend to live longer and healthier lives.⁸² Indicators such as school attendance and absenteeism, achievement on standardized testing, high school graduation rates, and adult educational attainment can provide valuable information about a region's educational engagement and success.

School attendance and absenteeism. School attendance and academic engagement early in life can significantly impact the direction of a child's schooling trajectory. Chronic absenteeism is defined as missing more than 10 percent of the school days within a school year, and it affects even the youngest children, with more than 10 percent of US kindergarteners and first graders considered chronically absent.⁸³ Poor school attendance can cause children to fall behind, leading to lower proficiency in reading and math and increased risk of not being promoted to the next grade.⁸⁴ Consistent school attendance is particularly important for children from economically disadvantaged backgrounds, the group of children most at risk for chronic absenteeism.^{85,86}

Achievement on standardized testing. A child's third-grade reading comprehension skills have been identified as a critical indicator of future academic success.⁸⁷ Students who are at or above grade level reading in 3rd grade are more likely to go on to graduate high school and attend college.⁸⁸ The link between poor reading skills and risk of dropping out of high school is even stronger for children living in poverty. More than a quarter (26%) of children who were living in poverty and not reading proficiently in 3rd grade did not finish high school. This is more than six times the high school dropout rate of proficient readers.⁸⁹

In 2010, the Arizona legislature, recognizing the importance of early identification and targeted intervention for struggling readers, enacted *Move on When Reading* legislation. As of 2015, the statewide assessment tool for English language arts (ELA), including reading and writing, is Arizona's Measurement of Education Readiness to Inform Teaching (AzMERIT).^{vii,90} AzMERIT scores are used to determine promotion from the 3rd grade in accordance with the *Move on When Reading* policy. *Move on When Reading* legislation states that a student shall not be promoted to fourth grade if their reading score falls far below the third-grade level, as established by the State Board of Education.⁹¹ Exceptions exist for students identified with or being evaluated for learning disabilities and/or reading impairments, English language learners, and those who have demonstrated reading proficiency on alternate forms of assessment approved by the State Board of Education.

^{vii} AzMERIT was renamed AzM2, a change that will take effect during the 2019-2020 school year.

Graduation rates and adult educational attainment. Ultimately, adult educational attainment speaks to the assets and challenges of a community’s workforce, including those who are working with or on behalf of young children and their families. Adults who have graduated from high school have better health and financial stability, lower risk for incarceration, and better socio-emotional outcomes compared to adults who dropped out of high school.^{92,93} Children whose parents have higher levels of education are more likely to have positive outcomes related to school readiness and educational achievement, promoting academic success across generations.⁹⁴ Given the cascading effect of early education on later academic achievement and success in adulthood, it is critical to provide substantial support for early education and promote policies and programs that encourage the persistence and success of Arizona’s children.

What the Data Tell Us

School Attendance and Absenteeism

- In the 2018-2019 school year, 1,706 children were enrolled in preschool in the Pima North Region. Kindergarten through 3rd grade enrollments for the region were all relatively similar, ranging from 6,666 in kindergarten to 6,859 in 3rd grade (Table 28).
- Kindergarten through 3rd grade chronic absence rates steadily increased from 2015-2016 to 2018-2019 at the regional, county, and state level. During the 2018-2019 school year, the Pima North Region had a 13 percent chronic absence rate, with 4,404 kindergarten through 3rd grade students in the region chronically absent (Table 29 & Table 30).
- By grade level, chronic absences ranged from 8 percent to 16 percent in the Pima North Region. In the region and county, chronic absences were highest among 1st grade students (16% and 17%, respectively), while state-level chronic absences were highest among kindergarteners (13%) (Table 31).

Achievement on Standardized Testing

- Fewer than half of 3rd grade students are meeting proficiency expectations for 3rd grade literacy. Slightly more than half are meeting proficiency expectations for math.
- Arizona's Measurement of Educational Readiness to Inform Teaching (AzMERIT) 3rd Grade English Language Arts passing rates for the Pima North Region (44%) mirrored statewide passing rates (44%) in 2017-2018 (Table 32 & Figure 6).
- AzMERIT 3rd Grade English Language Arts passing rates remained relatively constant over time at the region, county, and state levels between 2015-2016 and 2017-2018 (Figure 7).
- AzMERIT 3rd Grade Math passing rates for the Pima North Region (53%) also mirrored statewide passing rates (53%) in 2017-2018 (Table 33 & Figure 8).
- AzMERIT 3rd Grade Math passing rates improved over time at the region, county, and state level, with regional passing rates increasing from 48 percent in 2015-2016 to 53 percent in 2017-2018 (Figure 9).

Graduation Rates and Adult Educational Attainment

- In 2017, the Pima North Region had a four-year graduation rate of 74 percent and a five-year graduation rate of 80 percent. Since 2015, both the four-year and five-year graduation rates have declined in the Pima North Region (Table 34, Table 35, & Table 36).
- The 7th-12th grade dropout rate for Pima North increased from 4 percent in 2015-2016 to 6 percent in 2017-2018 (Table 37).
- A larger proportion of adults have more than a high-school education in the Pima North Region (69%) than in Pima County (66%), Arizona (62%), and the United States overall (60%) (Figure 10).

- This difference is also seen specifically in mothers giving birth, with a larger proportion of births to mothers with more than a high-school education in the Pima North Region (61%) than the county (57%) and state (56%) (Table 38).

Pima County	3,027	10,203	10,414	10,587	10,771
Arizona	21,238	79,990	81,913	81,951	83,037

Source: Arizona Department of Education (2019). 2018-19 October 1 Enrollments. Custom tabulation of enrollment data facilitated by state agency staff.

Note: Data on enrollments were calculated at the district-level. Where districts were split between regions, district enrollments were apportioned to regions based on the percentage of K-3 students in each region within the district. See appendix 3 for a full list of districts within the region, including split districts. Data on K-3 students enrolled at Dan Hinton Accommodation School in Pima, AZ were mistakenly included in calculations for Pima North, resulting in 14 additional K-3 students included in Pima North enrollment figures.

Early Learning

Why it Matters

Early childhood is an exciting time of rapid physical, cognitive, and social-emotional development. The experiences young children have during these early years are critical for healthy brain development and set the stage for lifelong learning and well-being.^{95,96} Just as rich, stimulating environments can promote development, early negative experiences can have lasting effects. For example, gaps in language development between children from disadvantaged backgrounds and their more advantaged peers can be seen by 18 months of age;⁹⁷ those disparities that persist until kindergarten tend to predict later academic problems.⁹⁸

Access to early care and education. Though high-quality early care and education can promote development, families often face barriers in accessing these opportunities for their children. Families living in rural areas are more likely to face an inadequate child care supply, but Arizona families in both urban and rural areas face a gap between the number of young children and the availability of licensed child care.^{99,100,101} In fact, Arizona has a deficit of about 22,230 licensed early care and education slots to meet the needs of working families, without accounting for parents continuing their own education, or those not in the workforce but seeking out early learning programs to help assure their preschool age children are able to make a strong start in school.¹⁰² Even when early education is available, the cost can be prohibitive. According to the U.S. Department of Education, only 19 percent of four-year-olds in Arizona are enrolled in publicly-funded free or reduced cost preschool programs, compared to 41 percent nationally.¹⁰³ If not enrolled in publicly-funded programs, the annual cost of full-time center-based care for a young child in Arizona is nearly equal to the cost of a year at a public college.^{104,105}

Child care subsidies can be a support for families who have financial barriers to accessing early learning services.¹⁰⁶ In June 2019, for the first time since the Great Recession, the Arizona Department of Economic Security's (DES) child care subsidy waiting list was suspended, meaning all children who qualify for subsidies are able to receive them, assuming that they are able to find a provider.¹⁰⁷ This is due to \$56 million in additional federal funds from the Child Care and Development Fund (CCDF) that was authorized by the State Legislature, and the funding increase has also allowed DES to increase provider reimbursement rates, which may make it easier for families to use their child care subsidies.¹⁰⁸

High quality early care and education. In addition to the early experiences children have in their homes, high quality early care and education services can also promote physical, cognitive, and social-emotional development and health, particularly for children from disadvantaged backgrounds.^{109,110,111} Children whose education begins in high quality preschool programs repeat grades less frequently, obtain higher scores on standardized tests, experience fewer behavior problems, and are more likely to graduate from high school.¹¹² This translates

into a return on investment to society through increased educational achievement and employment, reductions in crime, and better overall health of children as they mature into adults.^{113,114} Not only does access to affordable, quality child care make a positive difference for children's health and development, it also allows parents to maintain stable employment and support their families.¹¹⁵

Establishing that available early care and education programs meet quality standards is important to ensure these early environments support positive outcomes for children's well-being, academic achievement, and success later in life.¹¹⁶ Providers are considered quality educational environments by the Arizona Department of Economic Security if they receive a Quality First three-star rating or higher (see below) or are accredited by a national organization, such as the Association for Early Learning Leaders or the National Association for the Education of Young Children (NAEYC)¹¹⁷.

High quality early education environments have teachers with more education, experience, and supports that increase their skills in developing positive teacher-child interactions, providing enriching age-appropriate experiences and guiding appropriate behaviors.¹¹⁸ These quality environments may be particularly important for children with challenging behaviors, because lower teacher-child ratios and access to professional development and early childhood mental health consultation can help avoid preschool expulsion.^{119,120,121}

Quality First is Arizona's Quality Improvement and Rating System (QIRS) for early child care and preschool providers.¹²² A Quality First Star Rating represents where along the continuum of quality (1 to 5 stars) a program was rated and how they are implementing early childhood best practices. One star indicates a program is participating in Quality First, is regulated, in good standing, and is making the commitment to work on quality improvement. Three stars indicate that a program is of good quality care, and families can be confident that children are well cared for in such an environment. Five stars indicate the highest level of quality attainable, where families will find low staff-child ratios and group sizes, highly educated personnel, and strong curriculum which optimizes children's comprehensive development. The number of providers across the state that meet quality standards (three-star rating or higher) has increased across the last 5 years such that 25 percent of the 857 participating providers in 2013 met or exceeded quality standards, and 76 percent of 1,032 participating providers in 2019 met or exceeded quality standards.¹²³

High quality early care and education practices, including lower teacher-child ratios, access to professional development, and early childhood mental health consultation, can help avoid preschool expulsion.^{124, 125} Nationally, preschool expulsions and suspensions occur at high rates and disproportionately impact children of color, specifically young Black boys.^{126,127} In 2016, an estimated 50,000 preschoolers were suspended and 17,000 preschoolers expelled nationwide, with Black children 2.2 times more likely to be suspended or expelled than other children.¹²⁸ The U.S. Department of Education Office of Civil Rights began collecting data on preschool suspension and expulsion in 2011 and, as a result of federal changes to the Child Care

Development Block Grant in 2014, Arizona began collecting provider-reported data on early learning environment expulsion in 2017.^{129,130} Given the positive impact of early educational experiences on children’s cognitive and emotional development and the negative impact of suspension and expulsion on educational outcomes, it is essential to identify areas with higher rates of expulsion to provide targeted supports.¹³¹

As an alternative to expulsion, early education providers in Arizona have an opportunity to identify young children as being at risk for expulsion and to receive consultation from experts to help intervene in problem behaviors. Consultation is provided through on-site mental health consultation, available for Quality First and some non-Quality First providers in most but not all regions in the state, as well as through a statewide Department of Economic Security (DES)-managed hotline. If that child is then able to remain in the center, this is documented as a prevented expulsion and their case is closed out. The reported number of prevented expulsions of young children receiving subsidies increased from seven in 2017 to 45 in 2018.

Young children with special needs. The availability of early learning opportunities and services for young children with special needs is an ongoing concern across the state, particularly in the more geographically remote communities and some tribal communities. Children with special health care needs are defined as “those who have or are at increased risk for a chronic physical, developmental, behavioral, or emotional condition and who also require health and related services of a type or amount beyond that required by children generally.”¹³² Adverse Childhood Experiences (ACEs)^{viii} include childhood experiences of abuse, neglect, and other forms of potential trauma. According to the National Survey of Children’s Health, children with special health care needs are more likely to experience more adverse childhood experiences than typically developing children,¹³³ and are at an increased risk for maltreatment and neglect,^{134,135} suggesting they may particularly benefit from high quality teacher-child interactions in classrooms.^{136,137} Almost half (46%) of families with a child with special needs in Arizona have incomes below 200 percent of the federal poverty level, suggesting that even if they can identify an appropriate provider, affording quality care is likely to be a burden.¹³⁸

Ensuring all families have access to timely and appropriate screenings for children who may benefit from early identification of special needs can help improve outcomes for these children and their families. Timely intervention can help young children with, or at risk for, developmental delays improve language, cognitive, and socio-emotional development.^{139,140} It also reduces educational costs by decreasing the need for special education.¹⁴¹ In Arizona, services available to families with children with special needs include those provided through the Arizona Early Intervention Program (AzEIP),¹⁴² the Arizona Department of Education Early

^{viii} ACEs include 8 categories of traumatic or stressful life events experienced before the age of 18 years. The 8 ACE categories are sexual abuse, physical abuse, emotional abuse, household adult mental illness, household substance abuse, domestic violence in the household, incarceration of a household member, and parental divorce or separation.

Childhood Special Education program,¹⁴³ and the Division of Developmental Disabilities (DDD).¹⁴⁴

What the Data Tell Us

Access to Early Care and Education

- In the Pima North Region, 43 percent of children (ages 3 and 4) are enrolled in nursery school, preschool, or kindergarten. While this is a larger proportion than the county (40%) and state (38%), it is lower than the national proportion (48%) (Table 39).
- In the Pima North Region, nearly all (97%) of licensed child care capacity is provided by child care centers, with a small proportion provided by family child care providers (3%) and nannies/individual providers (<1%) (Table 40).
- The Pima North Region has a higher percentage of providers who are accredited (16%) than the state (10%), as well as a higher percentage of potential child care slots (provider capacity) with accredited providers (19%) than the state (12%) (Table 41).
- Median monthly child care costs for certified group homes and licensed centers are similar across the region, county, and state. Median costs for approved family homes are as much as \$100 more per child per month in the Pima North Region compared to the state. Overall, licensed centers are the most expensive and approved family homes the least expensive for all ages in the region (Table 42).
- Child care costs are relatively more expensive in Pima County than in the state overall. At median levels, sending an infant to a licensed center requires over one-sixth (17%) of a family's income (Table 43). Given that one in five Pima North Region residents lives in poverty and one-third of Pima North Region households are spending 30 percent or more of their income on housing, this is a notable proportion of income needed to cover child care for families that may already have difficulty meeting their basic needs.
- Nearly all (95%) children who are not involved with the Department of Child Safety (DCS) and are eligible for Department of Economic Security (DES) child care subsidies in the Pima North Region have received them in recent years. This proportion is slightly higher than the state overall, with 92 percent of eligible children receiving child care subsidies in 2018 statewide (Table 44).
- For DCS-involved children specifically, the proportion of eligible children receiving subsidies in the region is lower than for all eligible children and has declined over time, from 92 percent in 2015 to 86 percent in 2018. This decline in DCS-involved children receiving subsidies was also seen at a state level, with 82 percent of DCS-involved children receiving subsidies in Arizona in 2018 compared to 91 percent in 2015 (Table 45).
- The proportion of eligible families not using DES child care subsidies has increased slightly over time at the region, county, and state level. In 2018, five percent of eligible families in the Pima North Region did not use their child care subsidies (Table 46).

High Quality Early Care and Education

- Quality educational environments are defined by the Department of Economic Security (DES) as providers that are accredited by a national organization or providers that have

received a state-approved quality indicator that is recognized by the department. From 2017 to 2018, the number of children receiving subsidies in quality environments, and particularly the number of DCS children in quality environments, increased at the regional, county, and state levels (Table 47).

- In 2019, a total of 135 child care providers in the Pima North Region participated in Quality First, 74 percent of which were quality-level settings (public 3-5 stars). Of the 7,395 children enrolled at a Quality First provider site in the region, 75 percent were enrolled at a quality-level setting (public 3-5 stars). In 2019, 950 children received Quality First scholarships (Table 48 & Table 49).
- In 2018, eleven early childhood expulsions of young children receiving child care subsidies were reported as prevented to the Department of Economic Security (DES) in Pima County (Table 50).

Young Children with Special Needs

- The number of young children (ages 3-5) enrolled in special education increased slightly from 2015-2016 (1,354) to 2018-2019 (1,387) in the Pima North Region (Table 51).
- The largest proportion of young children (ages 3-5) enrolled in special education in the region were diagnosed with a speech or language impairment (44%) or developmental delay (39%) (Table 52).
- Special education enrollment for 1st through 3rd grade students has continued to increase in the region since 2015-2016 (13%), with 15 percent of children in 1st through 3rd grades enrolled in special education in 2018-2019 (Table 53 & Table 54).
- From 2016 to 2017, the percentage of children (ages 0-2) who were referred to the Arizona Early Intervention Program (AzEIP) and found eligible increased from 55 percent to 60 percent in the Pima North Region (Table 55).
- From 2017 to 2018, the number of active AzEIP cases in the Pima North Region increased by four percent, with 813 active cases in 2018 (Table 56).
- The number of children receiving services from the Division of Developmental Disabilities (DDD) has increased over time at the region, county, and state levels since 2015. In the Pima North Region, the number of children ages 0-2 receiving DDD services has increased by 25 percent and the number of children ages 3-5 receiving DDD services has increased by 70 percent (Table 57 & Table 58).

Access to Early Care and Education

Table 39. School enrollment for children (ages 3 and 4)

Note: Approved family homes are family home child care providers who care for up to 4 children in their home and have completed the necessary steps to apply and be certified by DES or a tribal authority. Certified group homes are family home child care providers who care for 5-10 children in their home and are licensed ("certified") by ADHS or a tribal authority. Child care centers are child care providers who care for 10 or more children at a location separate from their residence and are licensed by ADHS or regulated by a military or tribal authority.

Child Health

Why it Matters

The physical and mental health of both children and their parents are important for optimal child development and well-being. Starting with the mother's health before pregnancy, many factors influence a child's health.¹⁴⁵ Exposures and experiences in utero, at birth, and during the early years set the stage for health and well-being throughout a child's life.^{146,147} Access to health insurance and preventive care influence not only a child's current health, but long-term development and future health.^{148,149,150}

Access to health services. The ability to obtain health care is critical for supporting the health of pregnant mothers and young children. Health care during pregnancy, or prenatal care, can reduce maternal and infant mortality and complications during pregnancy.^{151,152} In the early years of a child's life, well-baby and well-child visits allow clinicians to assess and monitor the child's development and offer developmentally appropriate information and guidance to parents.¹⁵³ Families without health insurance are more likely to skip these visits, and are less likely to receive preventive care for their children, or care for health conditions and chronic diseases.^{154,155} Thus, access to health insurance is an indicator of children's access to health services. Children who lack health insurance are also more likely to be hospitalized and to miss school.¹⁵⁶

Maternal, infant, and child health. A number of factors occurring before conception and in utero influence child health, making characteristics of pregnant women important determinants of the birth and developmental outcomes of their children. Pregnancy during the teen years is associated with a number of health concerns for infants, including neonatal death, sudden infant death syndrome, and child abuse and neglect.¹⁵⁷ Teenaged mothers (and fathers) themselves are less likely to complete high school or college, and more likely to require public assistance and to live in poverty than their peers who are not parents.^{158,159,160}

In addition to age, a mother's health status before, during, and after pregnancy influences her child's health. Women who are obese before they become pregnant are at a higher risk of birth complications and neonatal and infant mortality than women who are normal weight before pregnancy.^{161,162} Babies born to obese women are at risk for chronic conditions later in life such as diabetes and heart disease.¹⁶³ Preterm birth, in addition to being associated with higher infant and child mortality, often results in longer hospitalization, increased health care costs, and longer-term impacts such as physical and developmental impairments. Babies born at a low-birth weight (less than 5 pounds, 8 ounces) are also at increased risk of infant mortality and longer-term health problems such as diabetes, hypertension and cardiac disease.¹⁶⁴

Maternal mental health is a factor for children's well-being as well. Maternal depression during and after pregnancy negatively influences the mother's ability to maintain a healthy pregnancy as well as meet the demands of motherhood and form a secure attachment with her baby.^{165,}
¹⁶⁶ Quality preconception counseling and early-onset prenatal care can help reduce some of

these risks for poor prenatal and postnatal outcomes by providing information, conducting screenings, and supporting an expectant mother's health and nutrition.¹⁶⁷

Substance use disorders. A mother's use of substances such as drugs and alcohol also has implications for her baby. Babies born to mothers who smoke are more likely to be born early (pre-term), have low birth weight, die from sudden infant death syndrome (SIDS) and have weaker lungs than babies born to mothers who do not smoke.^{168,169} Opiate use during pregnancy, either illegal or prescribed, has been associated with neonatal abstinence syndrome (NAS), a group of conditions that causes infants exposed to these substances in the womb to be born exhibiting withdrawal symptoms.¹⁷⁰ This can create longer hospital stays, increase health care costs and increase complications for infants born with NAS. Infants exposed to cannabis (marijuana) in utero often have lower birth weights and are more likely to be placed in neonatal intensive care compared to infants whose mothers had not used the drug during pregnancy.¹⁷¹

Parental substance abuse also has other impacts on family wellbeing. According to the National Survey of Children's Health, young children in Arizona are more than twice as likely to live with someone with a problem with alcohol or drugs than children in the US as a whole (9.8 percent compared to 4.5 percent).¹⁷² Children of parents with substance use disorders are more likely to be neglected or abused and face a higher risk of later mental health and behavioral health issues, including developing substance use disorders themselves.^{173,174} Substance abuse treatment and supports for parents and families grappling with these issues can help to ameliorate the short and long-term impacts on young children.¹⁷⁵

Nutrition and weight status. After birth, a number of factors have been associated with improved health outcomes for infants and young children. One factor is breastfeeding, which has been shown to reduce the risk of ear, respiratory and gastrointestinal infections, SIDS, overweight, and type 2 diabetes.¹⁷⁶ The American Academy of Pediatrics recommends exclusive breastfeeding for about 6 months, and continuing to breastfeed as new foods are introduced for 1 year or longer.¹⁷⁷

A child's weight status can have long-term impacts on health and well-being. Nationwide, an estimated 3 percent of children ages 2-19 are underweight, 16.6 percent are overweight, and 18.5 percent are obese.^{178,179} Obesity can have negative consequences on physical, social, and psychological well-being that begin in childhood and continue into and throughout adulthood.¹⁸⁰ Higher birth weight and higher infancy weight, as well as lower-socioeconomic status and low-quality mother-child relationships, have all been shown to be related to higher childhood weight and increased risk for obesity and metabolic syndrome (which is linked to an increase risk of heart disease, stroke, and diabetes).^{181, 182}

Oral health. Oral health and good oral hygiene practices are important to children's overall health. Tooth decay and early childhood cavities can have short- and long-term consequences including pain, poor appetite, disturbed sleep, lost school days, and reduced ability to learn and concentrate.¹⁸³ A national study showed that low-income children were more likely than higher-income children to have untreated cavities.¹⁸⁴ Despite high percentages of young

Arizona children who have preventative dental care visits (68.4%) compared to the national average (57.8%), there is a relatively high percentage who have had decayed teeth or cavities (11.1%) compared to those across the nation overall (7.7%).¹⁸⁵ Low-income children in Arizona, specifically, are more likely to have untreated cavities and less likely to have had an annual dental visit than their higher-income peers.¹⁸⁶

First Things First's Oral Health strategy was able to provide 24,664 children birth to age 5 with a dental screening, and 16,837 children with a fluoride varnish in the Arizona State Fiscal Year 2019.¹⁸⁷ Many children had untreated tooth decay and other oral health needs identified through the screenings. Further, attempts were made to connect children to dental homes who either did not already have a dental home or who needed dental care.

Childhood immunizations. Immunization against preventable diseases protects children and the surrounding community from illness and potentially death. In order to ensure community immunity of preventable diseases, which helps to protect unvaccinated children and adults, rates of vaccination in a community need to remain high.¹⁸⁸

Illness and injury. Asthma is the most common chronic illness affecting children¹⁸⁹, and it is more prevalent among boys, Black children, American Indian or Alaska Native children, and children in low-income households.^{190,191} The total healthcare costs of childhood asthma in the United States are estimated to be between \$1.4 billion and \$6.4 billion, but these costs could be reduced through better management of asthma to prevent hospitalizations.¹⁹² Unintentional injuries are the leading cause of death for children in Arizona¹⁹³ and nationwide.¹⁹⁴ It is estimated that as many as ninety percent of unintentional injury- related deaths could be preventable through better safety practices, such as use of proper child restraints in vehicles and supervision of children around water.¹⁹⁵ Children in rural areas are at higher risk of unintentional injuries than those who live in more urban areas, as are children in Native communities, suggesting that injury prevention is an especially salient need in these areas.^{196,197}

One useful metric for evaluating child health in Arizona are the Healthy People objectives. These science-based objectives define priorities for improving the nation's health and are updated every 10 years. Understanding where Arizona mothers and children fall in relation to these current national benchmarks (Healthy People 2020) can help highlight areas of strength in relation to young children's health and those in need of improvement in the state. The Arizona Department of Health Services monitors state level progress towards a number of maternal, infant and child health objectives for which data are available at the county level, including increasing the proportion of pregnant women who receive prenatal care in the first trimester; reducing low birth weight; reducing preterm births; and increasing abstinence from cigarette smoking among pregnant women.¹⁹⁸

What the Data Tell Us

Access to Health Services

- In the Pima North Region, about one in ten (10%) people do not have health insurance coverage, a number that aligns with the nation (10%) but is slightly lower than the state of Arizona overall (12%) (Table 59).
- For young children specifically, health insurance coverage is slightly better than the overall population in the region but worse than coverage nationally, with seven percent of young children uninsured in the Pima North Region compared to four percent of young children uninsured nationally (Table 59 & Figure 11).
- Almost half of births (48%) in the Pima North Region were covered by AHCCCS^{ix} in 2017, a percentage slightly lower than the state average (53%). The proportion of births covered by the Indian Health Service (IHS) and self-paid births were comparable across the region, county, and state in 2017 (Table 60).

Maternal, Infant, and Child Health

- The Pima North Region had lower rates of prenatal care than Arizona as a whole, with a larger proportion of births to mothers who had no prenatal care at all (6%), no prenatal care in the first trimester (31.4%), and fewer than five visits if they did have prenatal care (12.2%) compared to state averages (2.9%, 26.4%, and 7.5% respectively). Neither the region nor the state met the Healthy People 2020 target of at least 77.9 percent of births to mothers who received prenatal care in the first trimester (Table 61).
- The proportion of babies born at low birth weight was slightly higher in Pima North (7.6%) than the county (7.2%) and state (7.5%) in 2017, though it still met the Healthy People 2020 target of no more than 7.8 percent (Table 62).
- For rates of preterm birth, the Pima North Region, along with the county and state, met the Healthy People 2020 target of no more than 9.4 percent of births before 37 weeks gestation (Table 62).
- The Pima North Region did not meet the Healthy People 2020 target for maternal use of tobacco during pregnancy (1.4%), with 6.4 percent of births to mothers using tobacco while pregnant (Table 62).
- In 2017, Pima County had an infant mortality rate (3.9 per 1,000 live births) that met the Healthy People 2020 target (6.0 per 1,000 live births) and was lower than the state average (5.6 per 1,000 live births) (Table 63).
- In 2016 and 2017, the rate of neonatal abstinence syndrome (i.e., opioid-addicted babies) in Pima County (14.3 per 1,000 live births) was almost twice the state rate (7.4 per 1,000 live births) (Table 64).

^{ix} AHCCCS is Arizona's Medicaid agency

Substance Use Disorders

- Between June 2017 and June 2018, there were 1,431 suspected opioid overdoses among people of all ages in Pima County (Table 65).
- In 2017, there were 176 deaths directly attributed to opioids in Pima County; this accounted for nearly one-in-five (19%) opioid-related deaths across the state (Table 65).

Nutrition & Weight Status

- In Pima County, rates of breastfeeding for infants in the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) were slightly higher than the state rates in 2018. While 80 percent of WIC infants were breastfed at some point in infancy, rates of breastfeeding declined with the baby's age. Although the American Academy of Pediatrics recommends exclusive breastfeeding until six months of age, at six months of age, only 28 percent of infants were ever breastfed and only 4 percent were exclusively breastfed in Pima County. Even at three months old, exclusive breastfeeding for WIC infants in Pima County was low (16%) (Table 66).

Oral Health

- In 2019, 555 children received at least one fluoride varnish and 721 children received at least one oral health screening in the Pima North Region as a result of the work of First Things First. Also in 2019, the Pima South Region had 687 children who received at least one fluoride varnish and 778 children who received at least one oral health screening as a result of First Things First (Table 67).

Child Immunizations

- Between 2015 and 2018, Pima County had 595 cases of influenza, 498 cases of respiratory syncytial virus (RSV), and 16 cases of varicella ("chickenpox") in young children (Table 68).
- Across all required immunizations, with the exception of hepatitis A, children in child care in the Pima North Region had higher vaccination rates than the state as a whole and met the Healthy People 2020 targets during the 2018-2019 school year. The region also exceeded statewide immunization rates and met all Healthy People 2020 targets for kindergarten immunizations during this time (Table 69 & Table 70).
- In terms of immunization exemptions among children in child care, between 2016 and 2019 the region had lower rates of children receiving religious exemptions and exemptions from all required vaccines than the state. During the 2018-2019 school year, 2.3 percent of children in child care received a religious exemption in Pima North compared to 4.5 percent of children statewide, and 1.6 percent of children in child care received exemptions from all required vaccines in Pima North compared to three percent of children statewide (Table 71).
- The Pima North Region also had lower rates of children in kindergarten receiving personal belief exemptions and exemptions from all required vaccinations than

statewide averages between 2016 and 2019. During the 2018-2019 school year, 4.1 percent of children in kindergarten received a personal belief exemption in Pima North compared to 5.9 percent of children statewide, and 2.5 percent of children in kindergarten received exemptions from all required vaccines in Pima North compared to 3.8 percent statewide (Table 72).

Illness and Injury

- Reasons for non-fatal hospitalizations of young children for unintentional injuries in the Pima North Region aligned with the county and state, with falls (31%) and poisoning (19%) the most common (Table 73).
- Reasons for non-fatal emergency room visits were also similar between region, county, and state, with falls (45%) and being 'struck by or against' an object or person (15%) the most common (Table 74).
- Between 2015 and 2017, there were 827 emergency room visits and 306 inpatient hospitalizations for asthma for young children in the Pima North Region. The average length of stay for asthma hospitalization (2.4 days) was longer for the Pima North Region than the state (1.9 days) (Table 75).
- Between 2015 and 2017, there were 174 deaths of children in the Pima North Region, 77 percent of which were in young children (134 deaths). The proportion of child deaths that involved young children was higher in the Pima North Region than in the county (73%) or state (71%) (Table 76).

Family Support and Literacy

Why it Matters

Families and caregivers play a critical role as their child's first and most important teacher. Positive and responsive early relationships and interactions support optimal brain development during a child's earliest years and lead to better social, physical, academic, and economic outcomes later in life.^{199,200,201,202} Parental and family involvement is positively linked to academic skills and literacy in preschool, kindergarten, and elementary school.²⁰³ Children benefit when their families have the knowledge, resources, and support to use positive parenting practices, and support their child's healthy development, nutrition, early learning, and language acquisition. Specifically, knowledge of positive parenting practices and child development has been identified as one of five key protective factors that improve child outcomes and reduce the incidence of child abuse and neglect.^{x,204}

Early literacy. Parental and family involvement is positively linked to academic skills and literacy in preschool, kindergarten and elementary school.²⁰⁵ Early literacy promotion, through singing, telling stories, and reading together, is so central to a child's development that the American Academy of Pediatrics has emphasized it as a key issue in primary pediatric care, aiming to make parents more aware of their important role in literacy.²⁰⁶

A child's reading skills when entering elementary school have been shown to strongly predict academic performance in later grades, emphasizing the importance of early literacy for future academic success.^{207,208} Home-based literacy practices between parents and caregivers and young children, specifically, have been shown to improve children's reading and comprehension, as well as children's motivation to learn.^{209,210} However, low-income families may face additional barriers to home-based literacy practices, including limited free time with children, limited access to books at home, and a lack of knowledge of kindergarten readiness.²¹¹

^x The Center for the Study of Social Policy developed Strengthening Families: A Protective Factors Framework™ to define and promote quality practice for families. The research-based, evidence-informed Protective Factors are characteristics that have been shown to make positive outcomes more likely for young children and their families, and to reduce the likelihood of child abuse and neglect. Protective factors include: parental resilience, social connections, concrete supports, knowledge of parenting and child development, and social and emotional competence of children.

Communities may employ many resources to support families in engaging with their children, including through targeted programs like home visitation programs and “stay and play” programs, or participating in larger initiatives like Read On Arizona or the national “Reach Out & Read” program.²¹²

Adverse childhood experiences. Unfortunately, not all children are able to begin their lives in positive, stable, nurturing environments. Experiences early in life can have lasting impacts on an individual’s mental and physical health. Adverse Childhood Experiences (ACEs) have been linked to future risky health behaviors (such as smoking, drug use, and alcoholism), chronic health conditions (including diabetes, depression, and obesity), poorer life outcomes (such as lower educational achievement and increased lost work time), and early death.²¹³ Alternatively, Positive Childhood Experiences (PCEs), including positive parent-child relationships and feelings of safety and support, have been shown to have similarly cumulative, though positive, long-term impacts on mental and relational health.²¹⁴ Nationally and in Arizona, very young children are most at risk for child abuse, neglect, and fatalities from abuse and neglect. In 2017, children five years old and younger made up more than half (55%) of child maltreatment victims in Arizona.²¹⁵ Future poor health outcomes are also more likely as an individual’s ACE score increases.²¹⁶ Children in Arizona are considerably more likely to have experienced two or more ACEs (27.3%), compared to children across the country (8.3%).²¹⁷ These children and their families may require specific, targeted resources and interventions in order to reduce harm and prevent future risk.²¹⁸

Mental and behavioral health. Behavioral health supports, both for children and caregivers, are often needed to address exposure to adverse childhood events. Infant and toddler mental health development involves the young child’s developing capacity to “experience, regulate and express emotions; form close interpersonal relationships; and explore the environment and learn.”²¹⁹ When young children experience stress and trauma they often suffer physical, psychological, and behavioral consequences and have limited responses available to react to those experiences. Understanding the behavioral health of mothers is also important for the well-being of Arizona’s young children. Mothers dealing with behavioral health issues such as depression may not be able to perform daily caregiving activities, form positive bonds with their children, or maintain relationships that serve as family supports.²²⁰

Child removals and foster care. There are situations where the harm in remaining with their family is determined to be too great to a child and they are removed from their home, either temporarily or permanently. In accordance with the Indian Child Welfare Act of 1978, many tribal governments manage their own child welfare systems that must work cooperatively with state systems.²²¹ Children involved in foster care systems often have physical and behavioral health issues, in addition to the social-emotional needs brought on by being removed from a parent’s care.²²² Foster parents often need education, support, and resources to ensure they are able to successfully care for foster children who may have these added health needs. According to a 2015 Arizona Department of Child Safety Independent Review, focusing on

evidence-based targeted interventions for families at risk of child removal – including home visitation, positive parenting programs, and family-based therapy – may help lower this risk, thus reducing placements in foster care systems.²²³

What the Data Tell Us

Home Visitation

- In 2019, 445 families in the Pima North Region received First Things First-funded home visitation services, including 28 families who successfully completed and graduated^{xi} from home visitation programs (Table 77).

Child Removals and Foster Care

- Between January 2018 and June 2018, there were 714 substantiated maltreatment reports in Pima County. Of those substantiated reports, the majority were related to neglect (86%), with a smaller proportion related to physical abuse (12%) and sexual abuse (2%). These proportions mirror statewide proportions during the same time period (Table 78).
- The statewide number of child removals by the Department of Child Safety (DCS) declined from 2014 to 2017 (Table 79 & Figure 12).
- Between January 2018 and June 2018, 15 percent of DCS reports resulted in a child removal in Pima County, with 832 children removed. While the percentage of children removed overall was similar between the county and state, there was a higher percentage of children with a prior removal in the last 24 months in Pima County (13%) than the state (9%) (Table 80).
- While the number of foster placements declined from 2015 to 2018, the statewide number of licensed foster homes steadily increased during this time (Table 81 & Table 82).

^{xi} Graduation rates do not necessarily reflect those retained in the program. Families who did not graduate may still be continuing in the program.

Home Visitation

Table 77. First Things First-funded home visiting program data, State Fiscal Year 2019

GEOGRAPHY	NUMBER OF FAMILIES SERVED	FAMILIES SUCCESSFULLY GRADUATED FROM HOME VISITATION PROGRAMS
Pima North Region	445	28
Arizona	4,106	241

Source: First Things First. (2019). Home Visitation Program Data. Unpublished data received by request

Note: This is an unduplicated count of families who received home visitation services since the beginning of the contract year. Families are only counted one time during the year even if they enrolled in home visitation multiple times. Graduation rates do not necessarily reflect those retained in the program. Families who did not graduate may still be continuing in the program. Program completion/graduation is defined differently by home visitation models: PAT: Services are offered for 2 years or until the child ages out (age 6). HFAZ: Services are offered until the child is at least three years old and can continue up to age five. NFP: Services are offered prenatally until the child's 2nd birthday. Graduation rates do not necessarily reflect those retained in the program. Families who did not graduate may still be continuing in the program.

Systems Coordination among Early Childhood Programs and Services

Why it Matters

From November 2016 to June 2017, First Things First convened the second Arizona Early Childhood Task Force, comprised of diverse leaders from across the state. The goal of the task force was to create an ambitious, yet attainable, statewide five-year plan for First Things First and Arizona’s early childhood system. Building from the model early-childhood system developed in 2010, the task force identified six desired outcomes, one of which is “When the early childhood system is successful, everyone will benefit from living in communities where the early childhood system is high-quality, centered on children and families, coordinated, integrated and comprehensive.” First Things First’s role in building this system is to foster cross-system collaboration among local, state, federal, and tribal organizations to improve the coordination and integration of programs, services, and resources for young children and their families.

Through system building, First Things First connects various components of the early childhood system to create a more holistic system that promotes shared results for children and families. Agencies that work together are often easier for families to access, and the services they provide are more responsive to those families’ needs. Coordination efforts may also increase agencies’ capacity to deliver services by identifying and addressing gaps in the service delivery continuum. By supporting a variety of coordination efforts, First Things First aims to create a high quality, interconnected, and comprehensive system of early-childhood service delivery that enhances children’s overall development and that is timely, culturally responsive, family driven, and community based. Determining how these efforts are affecting each of the 28 regions and their families can help inform services, programs, and policy decisions to benefit families and young children throughout the state.

What the Data Tell Us

Family Engagement Network

The Family Engagement Network is creating multi-generational impact in Pima County. The Family Engagement Network is a collaboration between First Things First Pima North and Pima South Regional Partnership Councils, The United Way of Tucson and Southern Arizona, Pima Community College, and Pima County One-Stop. The goal of the Family Engagement Network is to build a collaborative system that mitigates barriers for families in Pima County accessing a workforce development program. The ultimate outcome of this system building is that parents are acquiring higher education and a career in a high-demand field, which will raise them out of poverty while their young children simultaneously have access to high-quality early learning and supports in their most formative years. Each partner within the Network brings their own unique expertise in understanding and supporting families with young children. First Things First Pima North and Pima South Regional Partnership Councils, build upon this system through their allocation of Quality First Scholarships to support the children birth to age 5 of the parents enrolled in the workforce development program. Pima Community College provides career-training programs to adults in Pima County with an emphasis on the Health Profession Opportunity Grant (HPOG) program. Pima County One-Stop, which is part of the Arizona@WORK statewide network of American Job Centers, provides workforce development and training programs and coordinates access to workforce resources for employers and job seekers. The United Way of Tucson and Southern Arizona provides administrative and fiscal oversight of the collaborative. The Family Engagement Network is truly working in support of educating dual generations and attempting to increase equitable, sustainable outcomes and break the cycle of poverty.

Family Support Alliance

The Family Support Alliance was developed in 2009 and is a collaborative effort aimed at creating a coordinated family support system to decrease barriers families may face when accessing supportive services. Through this collaborative, the home visitation programs and oral health program within the regions are collaborating to provide family-centered events. At these events, families have the opportunity to engage in parenting activities as well as receive an oral health screening and possible fluoride varnish for all children and expectant mothers that qualify. Through this collaborative effort, families have the opportunity to build relationships with other families in the program as well as gain knowledge on oral health and receive the necessary screenings.

Cradle 2 Career

Cradle 2 Career is a countywide effort engaging in collective impact to improve educational outcomes for every child in every school to ensure economic vitality for our community. The goals of this collective impact effort include:

- Every child is prepared for school
- Every student is successful in school and graduates prepared for college, career, and success in life
- All young people complete post-secondary education or training to prepare for a career
- Every young adult enters a career

These goals are being realized through the work of individual Change Networks focused on conducting research, utilizing data, and tracking the progress to identify effective practices that address the challenges and barriers identified. One of the Change Networks has prioritized Kindergarten Readiness and is working to address this immediately. Cradle2Career is a member of the StriveTogether Network meeting a rigorous set of benchmarks to earn its membership as a sustaining partnership in this national network. The StriveTogether framework provides Cradle 2 Career with strategic assistance that helps build on opportunities, solve issues, and overcome challenges.

Preschool Promise

Throughout the last two years, community members have been working to develop an initiative to ensure that more 3-4 year olds within the community have access to high quality preschool. This work began within the City of Tucson and provided an opportunity to build increased awareness of the importance of high-quality early care and education as well as the lack of access for families within Pima County. Additionally, this initiative galvanized community leaders to work together to expand those opportunities. The resulting recommendation was The Preschool Promise, an effort to use both private and public dollars to fund preschool for all low-income 3-4-year-olds in the Pima area. The recommendation included the requirement that children supported through the program attend quality early learning settings (as defined by earning 3-5 stars in Quality First) and that the amount of assistance result in no co-pays for families.

Communication, Public Information and Awareness

Why it Matters

Public awareness of the importance of early childhood development and health is critical in building a comprehensive, effective early childhood system in Arizona. Building public awareness and support for early childhood impacts individual behaviors as well as the broader objectives of system building. For the general public, information and awareness is the first step in taking positive action in support of children birth to age 5. This could include a range of actions—from influencing their personal networks by sharing early childhood information to actively encouraging community leaders to support programs and services for young children. For parents and other caregivers, awareness is the first step to engaging in programs or behaviors that will better support their child’s health and development.

There is no single communications strategy that will achieve the goal of making early childhood an issue that more Arizonans value and prioritize. Therefore, integrated strategies that complement and build on each other are key to any successful strategic communications effort. Employing a range of communications strategies to share information—from traditional broad-based tactics such as paid media advertising to grassroots, community-based tactics such as community outreach—ensures that diverse audiences are reached more effectively across multiple media platforms. A thoughtful and disciplined combination of methods of delivering information is required to ensure multiple messaging touch-points for diverse audiences: families, civic organizations, faith communities, businesses, local leaders, and others.

What the Data Tell Us

Since State Fiscal Year 2011, First Things First (FTF) has led a collaborative, concerted effort to build public awareness and support across Arizona employing integrated communications strategies that now include:

- strategic messaging and branding
- community outreach
- community awareness
- social media
- digital content marketing
- earned media
- paid media advertising

Progress toward building support for children birth to 5 can be measured by changes in awareness, attitudes and behaviors, as demonstrated through key results of a periodic statewide survey and through tactical impact measures. The most recent statewide survey was conducted in September 2018 and included a general phone survey as well as an online survey of parents of young children. Key results include the following:

- Those who agree that the state should ensure all children have access to early childhood services increased from 80 percent in 2012 to 84 percent in 2018.
 - Among parents, this measure increased from 81 percent in 2016 (the first available parent survey results) to 87 percent in 2018.
- Those who agree that a child who received early education and healthcare services before age 5 is more likely to succeed in school and beyond increased from 82 percent in 2012 to 88 percent in 2018.
 - Among parents, agreement increased from 85 percent in 2016 to 87 percent in 2018.
- Those who agree that the state should put the same priority on early education as it does on K-12 education increased from 62 percent in 2012 to 72 percent in 2018.
 - Among parents, agreement increased from 69 percent in 2016 to 74 percent in 2018.

While understanding and supporting early childhood in general is critical, it's also important that Arizonans have a trustworthy source of early childhood resources and know about the availability of early childhood resources, programs and tools. For this reason, building awareness of FTF as a credible source is critical. Results of the most recent statewide survey show that, while some progress has been made, there is still more to be done to increase awareness about FTF.

- In the 2018 general survey, 87 percent of respondents had never heard of FTF, compared to 89 percent in 2012.
 - Among parents specifically, more had heard of FTF, with 66 percent stating they had never heard of FTF, compared to 69 percent in 2016.

While this statewide survey offers a measure of broad changes in attitudes and awareness, specific tactical measures of awareness and support-building strategies employed by FTF offer another point of information. These include:

- FTF implemented three annual statewide awareness campaigns since the last regional needs and assets reporting period. The SFY17-SFY18 campaign - *Help Them Get There* - shared messaging about the importance of the early years for future school and life success and that parents’ everyday positive interactions with babies, toddlers and preschoolers promote healthy development. The SFY19 campaign – *Givers of Care* – focused specifically on the important role of caregivers and quality early learning environments.
- These paid campaigns reached a large number of Arizonans, measured through the total number of traditional and digital media impressions. Traditional media impressions refer to television, radio, cinema, and billboard ads, while digital media impressions refer to online ads which appear on both desktop and smartphone devices. These statewide impressions – which measure the estimated number of views of FTF ads – are detailed below.

Table 83. First Things First media awareness campaign impressions, SFY17-SFY19

	SFY17	SFY18	SFY19
Traditional media impressions	10 million	17 million	11 million
Digital media impressions	66 million	100 million	76 million

Source: First Things First (2019). Communications Strategy Data. Unpublished data received by request

- In addition, targeted digital advertising allows geographically-based targeting of audiences within regions with the ability to measure the number of click-throughs that digital ads garnered. The click-throughs delivered viewers to the FTF website. In SFY19, in the Pima North and Pima South Regions, digital advertising led to a total of 56,334 click-throughs to the FTF website where families could access more information and resources.

- In the area of social media, engagement with FTF early childhood online platforms has grown over the years. Particular success has been seen in the growth of Facebook Page Likes for FTF, which grew from just 3,000 in 2012 to 142,600 in 2019. Content is also distributed through Twitter, LinkedIn and Instagram.
- Since inception in SFY17, FTF’s digital content marketing strategy which targets parents and families with engaging and informative video and blog posts via website, social media, and email has expanded its reach. In SFY19, 40 original, high-quality content pieces were published.
- In SFY19, an online searchable database of early childhood programs funded by FTF in all the regions launched. In the first six months, over 24,187 visits were logged.

In addition, FTF began a community engagement effort in SFY14 to recruit, motivate and support community members to take action on behalf of young children. The community engagement program is led by community outreach staff in regions which fund the FTF Community Outreach strategy. This effort focuses on engaging individuals across sectors – including business, faith, K-12 educators, and civic organizations – in the work of spreading the word about the importance of early childhood as trusted, credible messengers in their communities.

Focused efforts to engage parents’ most trusted messengers – which include pediatricians – included creating and distributing a toolkit for health providers to help them better understand and share information on the statewide free Birth to 5 Helpline. This toolkit was also distributed to attendees of the annual conference of the Arizona Chapter of the American Academy of Pediatrics. Other statewide awareness partnerships included creation and distribution of a grocery list tip pad for parents and caregivers sharing Read On Arizona’s Smart Talk tips, a digital content sharing partnership with Expect More Arizona and partnering with the Arizona Association for the Education of Young Children on a social media campaign promoting Week of the Young Child.

Because Arizona is so vast – with more than 500,000 children under age 6 and nearly 400,000 households with kids under age 6 – engaging others in spreading the word about early childhood is critical to reaching across diverse geographic areas and expanding our reach. Supporters and Champions – who are trained in early childhood messaging and effective ways to share early childhood information - reported a total of 940 positive actions taken on behalf of young children throughout Arizona in SFY19. These actions range from leading presentations in support of early childhood to sharing FTF’s early childhood resources with parents at community events. The table below shows total recruitment of Supporters and Champions through SFY19 and actions taken in SFY19.

Table 84. FTF Engagement of Early Childhood Supporters and Champions, SFY19

GEOGRAPHY	SUPPORTERS	CHAMPIONS	SUPPORTER AND CHAMPION ACTIONS IN SFY19
Pima North Region	340	57	40
Arizona	6,258	1,170	940

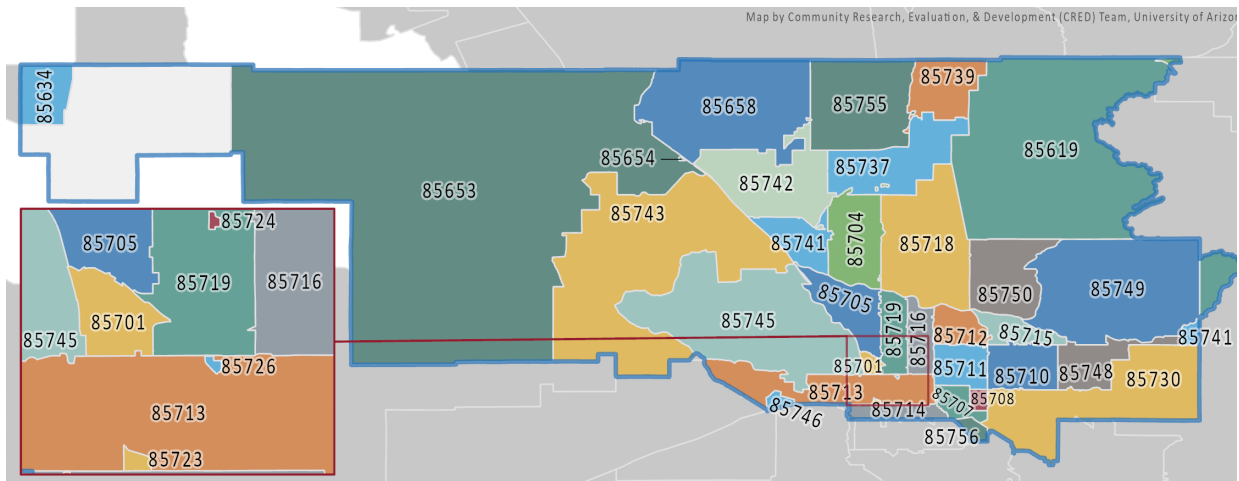

Source: First Things First (2019). Communications Strategy Data. Unpublished data received by request

First Things First has also led a concerted effort to build awareness among policymakers at all levels (federal, tribal, state, and municipal) of the importance of early childhood. This includes: in-office meetings with elected leaders to provide general information on early childhood, as well as discuss the impact of proposed legislation; regular communication to policymakers with updates on early childhood research and the work of FTF (such as a quarterly email newsletter for policymakers and their staff); and site tours of FTF-funded programs to allow policymakers to see the impact of early childhood investments in their area. In SFY19, FTF also launched ACT4KIDS, a text-based system that alerts participants to timely developments in early childhood policy and opportunities to engage with policymakers. In its first nine months of implementation, more than 700 Arizonans had signed up to participate in ACT4KIDS.

In addition, FTF actively participates in the Arizona Early Childhood Alliance, comprised of more than 50 early childhood system leaders like United Way, the state affiliates of the National Association for the Education of Young Children, Southwest Human Development, Children’s Action Alliance, Read On Arizona, Stand for Children, Expect More Arizona, and the Helios Foundation, which represents a united voice of the early childhood community in advocating for early childhood programs and services. For the past three years, the Alliance has also led an annual Early Childhood Day at the legislature, which draws hundreds of Arizonans to the state Capitol to engage with policymakers and show their support for early childhood development and health.

Source: Arizona Department of Education (2019). FY 2018 & FY 2019 Enrollment Data. Custom tabulation facilitated by agency staff.

Note: This table only contains Districts/LEAs with enrolled K-3rd grade students physically located within regional boundaries. It does not reflect the residence of students that attend these schools. It does not include high school districts. These are the districts and charter operators from which data on preschool to 3rd grade students were drawn for the tables and figures presented in this report. The percentage shown in the “Percent of K-3rd grade students in the region” column was used to apportion district-level enrollment counts to the region. All other data were aggregated at the school level. The “Schools in district/LEA” and “K-3rd grade students in district/LEA” columns reflect totals for the district, not only the portion within the region. *Data on K-3 students enrolled at Dan Hinton Accommodation School in Pima, AZ were mistakenly included in calculations for Pima North, resulting in 11 additional K-3 students in FY 2018 and 14 additional K-3 students in FY 2019 included in Pima North enrollment figures.
